LATTICE · FEATURE DECK

Keep a slide without showing it.

One line at the top of a slide hides it from Present and every export.

SECTION 01

How hiding works

A hidden slide stays in the deck

- It keeps its place in the source and in the editor
- Present skips it, and every export leaves it out
- Its notes and its review comments leave with it
- Page numbers count only the slides that show

Write one line to hide a slide

- Put `<!-- hide -->` on the first line of the slide
- `<!-- _hide -->` and `<!-- _hide: true -->` do the same
- `<!-- _hide: false -->` shows the slide again
- In the Studio, the slide menu's Hide Slide writes the line for you

The numbers skip nothing

- The slide before this one was a hidden divider, so it opens no section
- This slide reads page 5 of 6 in the PDF, and page 7 in the editor
- Hiding one heading of a split slide hides its whole block

Hide a slide, keep the deck.
