

# A roadmap that reads down the page.

A roadmap is a wide grid — workstreams down, phases across. On a tall deck those columns crush. So portrait picks the form the engine already had: the phase cards, stacked into one column you read top to bottom.

# Same table, the right shape for the box.

You author the same workstream × phase table. The kernel reads the deck's orientation and, on a tall box, transposes it to phase cards and stacks them — no second authoring.

Phases become cards →

**Same table, the right shape for the box.**

---

**Phases become cards, each carrying its workstream rows.**

# Same table, the right shape for the box. (cont.)

---

**Cards stack** down the page; the header collapses to one line and each row reads `LABEL · value` so three or four phases fit.

# Same table, the right shape for the box. (cont.)

---

**Landscape is untouched —**  
the wide table renders exactly  
as before.

---

Funnel, the keyed dials, the gantt, the state machine, the journey, and now the roadmap — the whole family restructures for a tall canvas instead of shrinking into a band. A portrait deck is a first-class surface, not an afterthought.
