BOOKEND MODIFIER · NUMBERED

The section stamp, back on the canvas

`numbered` stamps a running section index on a divider. It wrote that numeral onto `section::after` — the pseudo the engine reserves for the page number — and two separate owners took it back. It now rides the slide heading, as a masthead in the top band.

01

DIVIDER SILENT NUMBERED

This is the slide that rendered nothing.

DEFECT · THE PACK

NUMBERED · THE DIVIDER SECTION MARK

The browser path stripped the counter

`packTheme` comments out every `content` on a slide's own `::after` that isn't the pagination attribute — the guard that stops a theme clobbering the page number.

- The stamp survived in the emulator PDF
  - The CLI export path does not pack, so the counter stayed live and the numeral drew.
- The stamp vanished in the browser
  - The docs Playground, the Studio and `lib/runtime` all load the packed stylesheet, where the declaration came out as a comment.

DEFECT · SILENT

NUMBERED · THE DIVIDER SECTION MARK

`silent` nulled the same pseudo

`silent` suppresses the page number with `section.silent.silent::after { content: none }`, doubled to `(0,2,2)`. The stamp's selector scored `(0,2,2)` too.

- A tie goes to source order
  - `base.variants.css` loads after `base.modifiers.css`, so `content: none` won and the numeral never generated a box.
- Every shipped sample hit it
  - `divider.docs.md`, the manifest and `divider.gallery.md` all read `divider silent numbered` — precisely the losing pair.

02

DIVIDER NUMBERED

The dark divider counts its own series.

03

DIVIDER LIGHT NUMBERED

The light divider continues the same count.

THE FIX · CARRIER

NUMBERED · THE DIVIDER SECTION MARK

Move the carrier, not the geometry

The numeral now rides `section.divider.numbered :is(h1, h2)::after` — a selector the pagination mask cannot cross, sharing no pseudo with `silent`.

- The heading carries it, the section anchors it
  - `position: absolute` resolves against the section, so the mark measures from the slide corner rather than from wherever the heading sits.
- The heading is undisturbed
  - An absolutely positioned pseudo is out of flow, so `text-wrap: balance` and the bookend measure are unaffected.
- The page number came back
  - `numbered` no longer eats the pagination pseudo, so this slide shows both its mark and its page number.

THE FIX · INK

NUMBERED · THE DIVIDER SECTION MARK

A section marker is content, so ink it to be read

Drawing again exposed a second defect: the numeral sat on the 12% decoration rung under an `opacity` — 1.4:1.

- The rung was wrong, not the value
  - The ramp's rule is that text takes `primary` or `secondary` and `ghost` draws lines. The numeral takes `secondary`; the hairline under it takes `ghost`.
- The `opacity` is gone, not re-tuned
  - A wash steps ink and backdrop down together, by whatever headroom each already had.
- Measured, not asserted
  - 5.05:1 to 11.79:1 across the shipped palettes.

THE FIX · PLACEMENT

Pinned to the section, chosen on stability

Three shapes were rendered and stressed against headings of one to five lines.

The masthead was the only one that holds the same position on every divider.

- Locked into the headline block
  - Read beautifully in a still, and its height on the canvas moved 22% to 14% as the heading grew. For a running marker that is a defect.
- Pinned bottom-left
  - Held position, but the block grows toward it: clear at three lines, overlapping at five. The masthead does the same at four — which is what the band is for.
- Pinned top, and the band reserved
  - Pinning alone was not enough. The next slide is why.

THE FIX · THE BAND

NUMBERED · THE DIVIDER SECTION MARK

Reserve the band, and the failure gets loud

A centered block grows both ways, so at four lines the heading climbed into the mark.

- Padding, plus `safe center`
  - The padding reserves the band; `safe center` falls back to `start` when the block would overflow, so its top edge stops there.
- Short headings do not move
  - The reservation is symmetric, so one and two lines render byte-identically.
- The overflow machinery takes over
  - Growth runs at the frame now, so a long heading trips the export warning. An overlap was never an overflow.

THE FIX · SCOPE

NUMBERED · THE DIVIDER SECTION MARK

One counter, dividers only

Three counters used to run in parallel — `divider`, `divider light` and `closing` each restarting at 01. A closing that announces itself as section 01 is a number telling the room nothing.

- One series
  - `divider` and `divider light` share `lat-divider`, so mixing them never restarts the count.
- No bookends
  - `closing` and `title` do not take the modifier. A bookend is not a section.
- The chrome steps aside
  - A numbered divider suppresses its header and footer: the masthead owns the top band. The page number stays.

The closing carries no stamp, by design.
