LABEL SETS · MATRIX-GRID · AND THE ONE SHAPE THAT GETS NO NAME

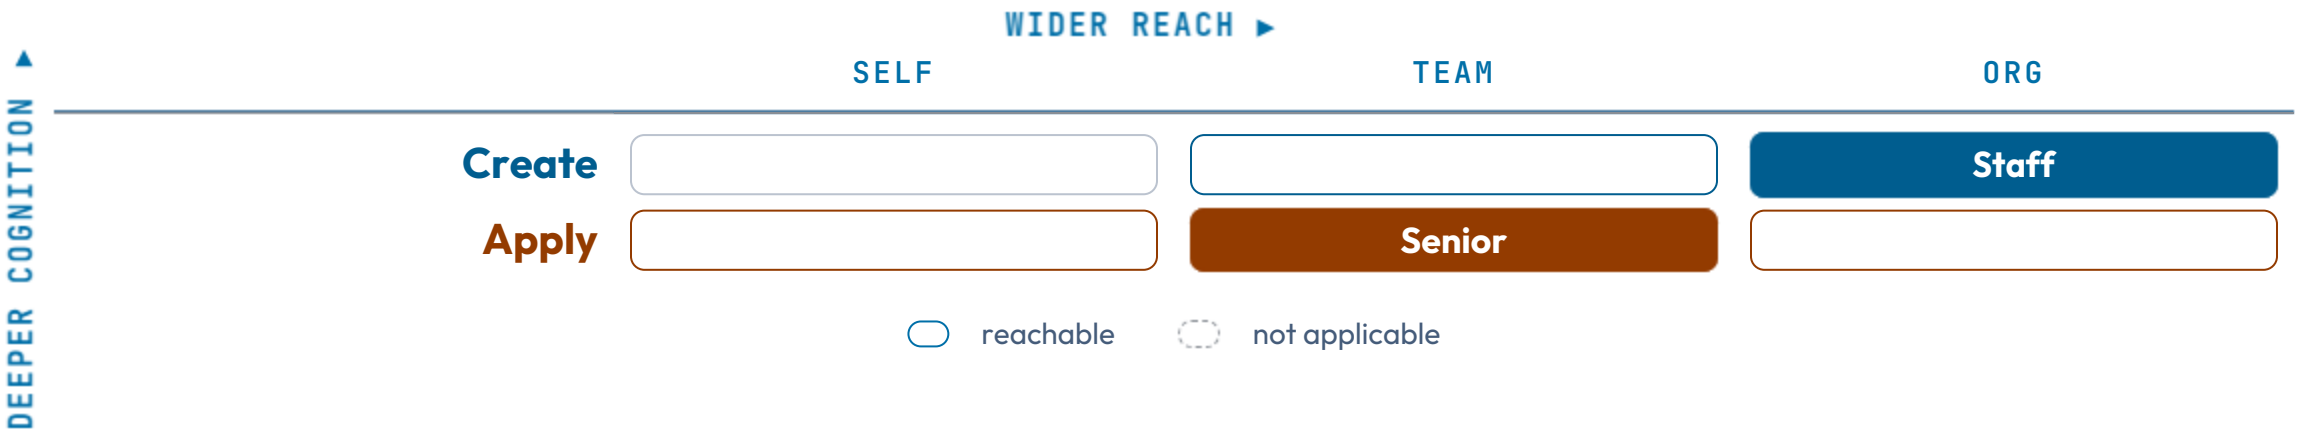

The key that existed for screen readers only.

This grid's shape vocabulary shipped in a map whose words reached a screen reader and nobody looking at the slide. The key now draws them — and refuses to draw one of them, on purpose.

Your level is a cell, not a rung.

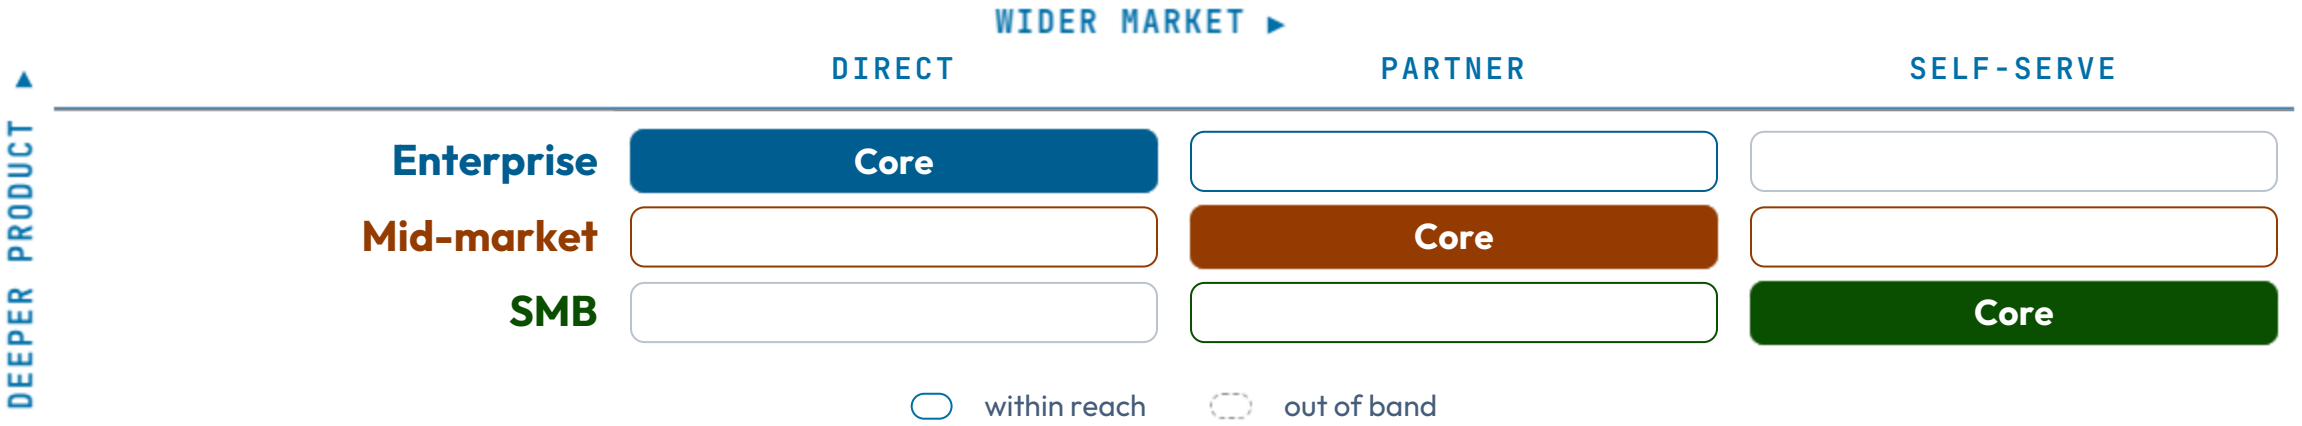

A filled cell already says what it is.

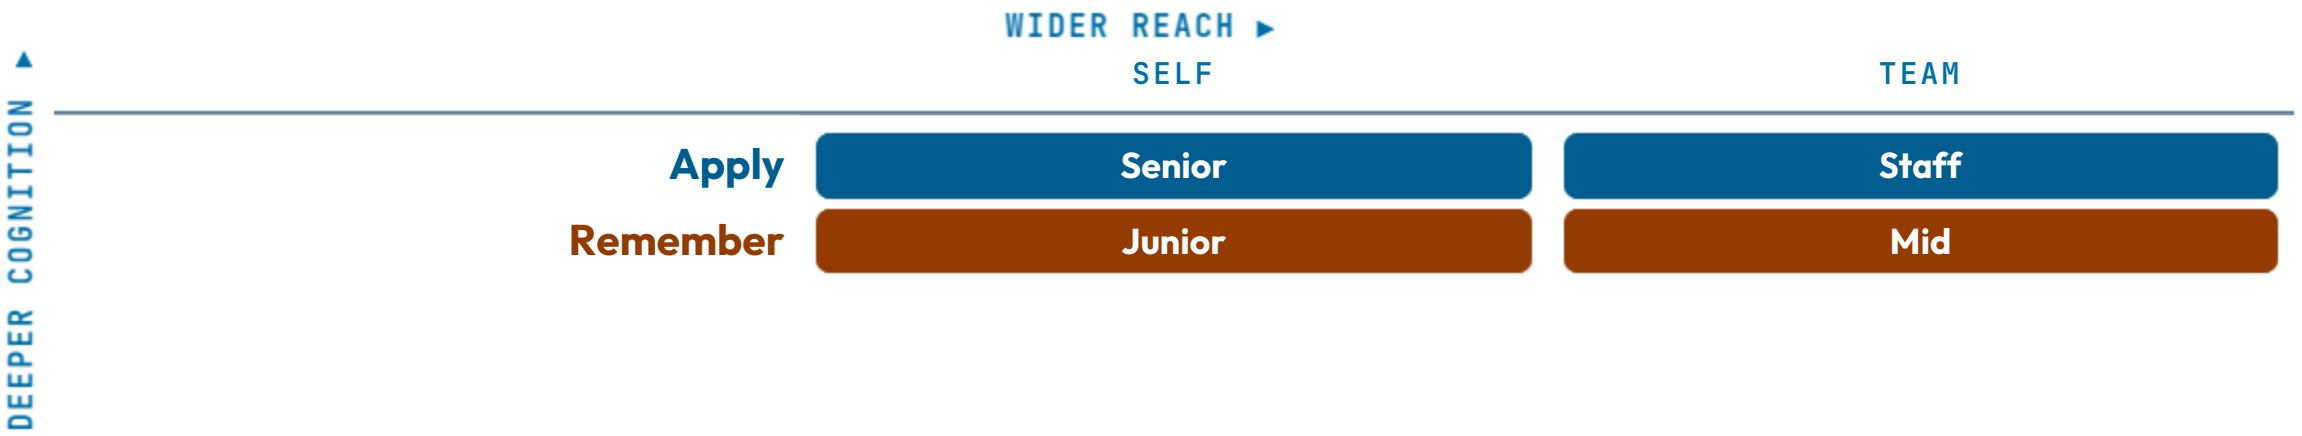

Its own trailing text is its label — Staff, Senior. A key row reading "filled" would repeat that on every slide, worse.

The same grid, for market coverage.

No key when there is nothing to decode.

Every cell labels itself, so the grid draws no key at all.

What changed.

- The shape words now reach the slide, not just the screen reader
- Only the shapes actually present get a row
- Two shapes are keyable; the filled one is refused, with a reason
- The refusal is declared in the manifest, so the deck lint can explain it
- Two code spans in one paragraph are still the axis names, not a label set
