

FIX · SPLIT-PANEL · SPLIT-COMPARE

Split panels hold their frame

The running chrome stays on its field, and the finish reaches both sides of the seam.

WHY LATTICE

Drag-the-box tools vs. a deck that is already designed.

Both put pixels on a slide. Only one keeps its taste when the content changes.

SLIDE EDITORS

- You place every box, line, and color by hand
- Restyling means re-touching slides one by one
- Consistency depends on whoever edited last

LATTICE

- You write the content; the engine composes the slide
- One theme restyles the whole deck, every slide at once
- The design system holds the line on every slide

RECOMMENDATION

Chrome ends at the rail; the corner tick clears the cards.

WHAT CHANGED

The chrome stays on the field it starts on.

The header and footer used to cross the seam in the panel's ink, where they vanished.

One line, one budget

A long line ends in an ellipsis at the panel's edge.

A band the panel keeps clear

The heading can never grow into the chrome.

The author still hears about it

The export names the cut; the reader sees no pill.

F

**Finish shows through
the accent.**

The panel keeps a tint, not a flood

A wash over the backdrop

The accent tints the panel; strata's dots read through.

A seam and an edge bar

The split still reads without the solid field.

Canvas inks on the veil

Every rung re-inks through one token block.

The mirror budgets the other side

The chrome stops where the panel begins.

The footer is chrome again

It stays a slide child, so `no-footer` reaches it.

SPLIT-PANEL METRIC MIRROR

3fixes

Header budget, finish passthrough,
and the footer split-compare used to
drop.

Tint survives the veil.

Does the category still read?

A proof panel keeps a wash of its category color, so the sequence still reads as steps.

YOU KNOW YOU'RE HERE WHEN

The panel tint still names the stage on a finish deck.

A SEAM MARKS THE SPLIT

One hairline where the solid field used to end.

THE EDGE BAR KEEPS ITS HUE

The category mark still runs along the top.

DARK SLIDE

The same rules hold on a dark slide.

A per-slide `dark` composes with the finish and the chrome budget.

BEFORE

- Opaque fields hid the finish
- Chrome crossed the seam

AFTER

- The finish reaches both fields
- Chrome ends at the rail

RECOMMENDATION

Without a `finish:`, the split renders its solid field exactly as before.

SPLIT PANELS • FIX

**Every split slide keeps
its frame, finish or not.**
