gantt

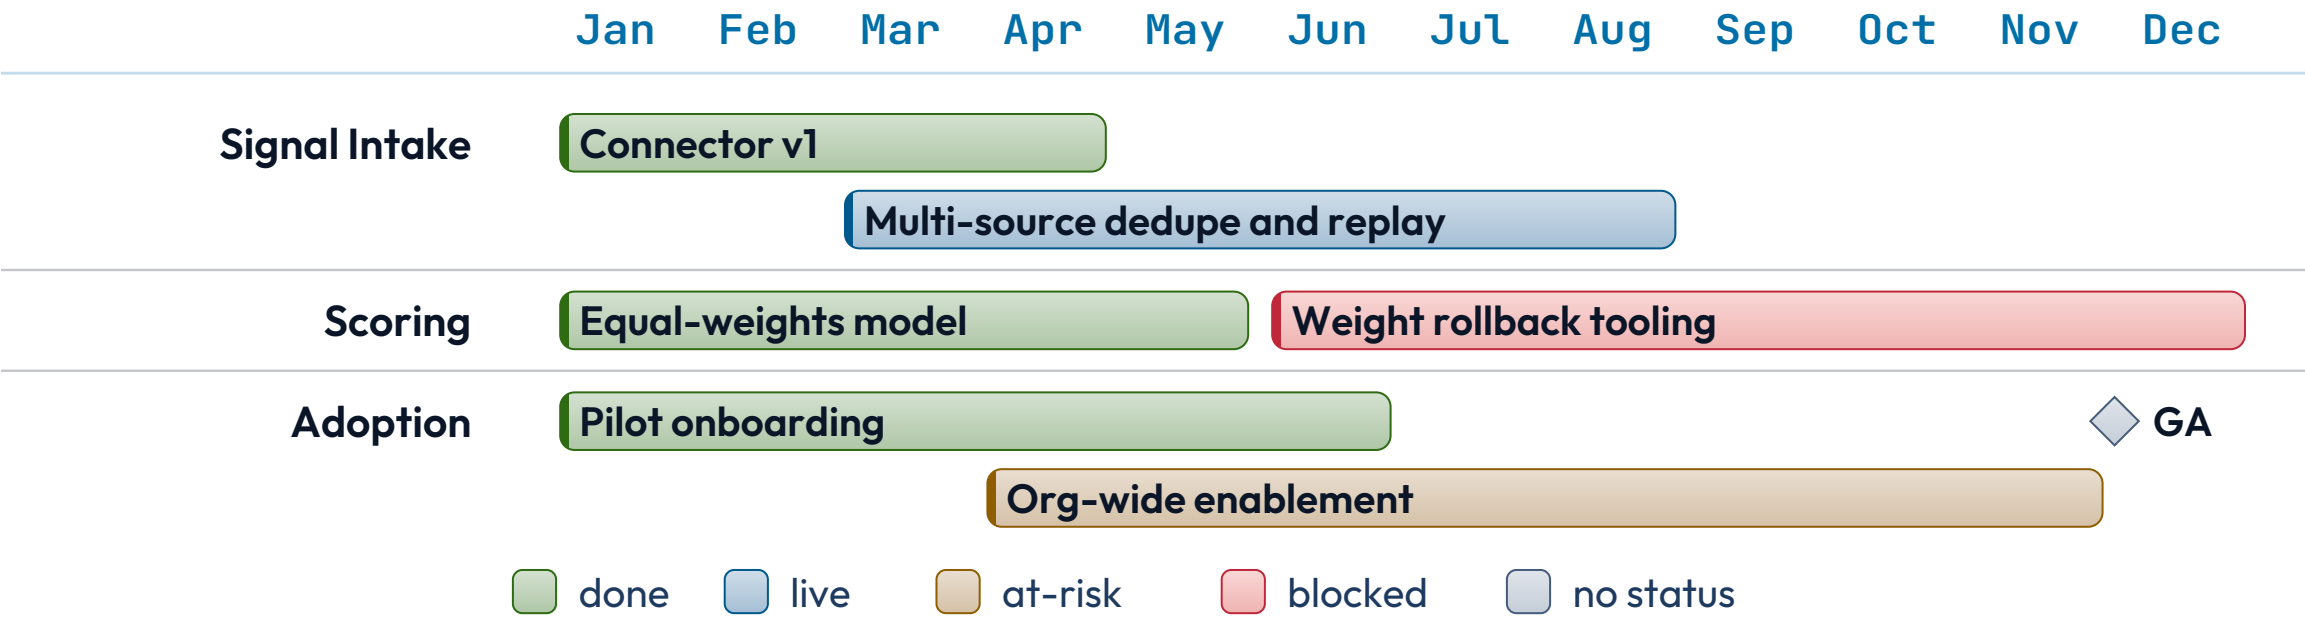

Gantt chart — task bars across a date axis.

A gantt lays overlapping work against a shared calendar.

Bars are spans, diamonds are moments, color is status, and tasks that run at the same time stack rather than hide each other.

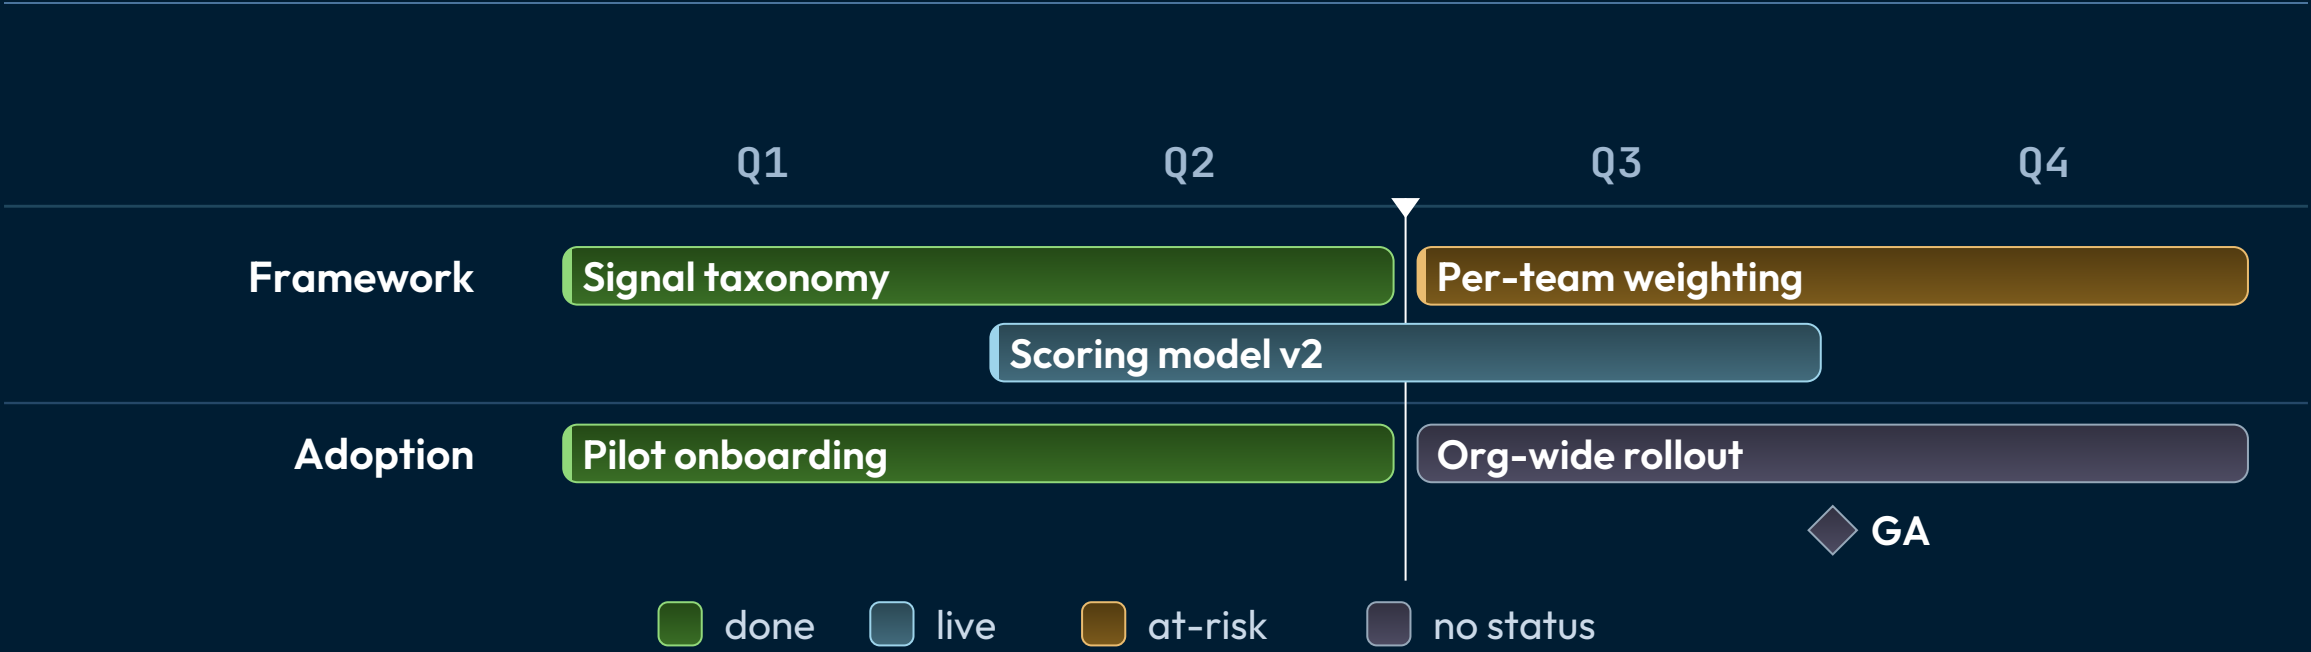

Every lane overlaps, at the row budget.

When NOT to reach for gantt.

Single workstream

One lane of bars is a timeline, not a gantt. Use `timeline` or `list-steps` when there is no parallel work to coordinate.

When NOT to reach for gantt.

More rows than the stage holds

Count ROWS, not lanes: overlapping tasks stack, and inclusive spans overlap more than they look (Q1..Q2 then Q2..Q3 share Q2). With a status key, four one-row lanes fit an ordinary slide and five overflow. The chart does not shrink to absorb them — the bars keep their size, the chart grows taller, and past the budget it overflows and the render says so. Group lanes (collapse 'SDK' subdomains into 'SDK'), make genuinely sequential phases non-overlapping, or split into two slides.

When NOT to reach for gantt.

No spans at all

A gantt mixes bars with the odd milestone — but if every task is a point-in-time event with no durations, use `timeline` or `roadmap milestones`. gantt earns its chrome only when bars carry meaningful length.
