

MARKER CORNER · STAMP, LOGO, AND THE BAND BELOW THE BAR

The corner held four things. Now it holds two.

Four absolutely-positioned boxes wanted the slide's top-right, and the arithmetic that kept them apart was wrong four times. This deck renders the answer: the two that were transient moved out.

Two are permanent. Two were passing through.

- The status stamp
 - Paints on the section's own `::before`, flush to the corner. It ships in the export.
- The deck logo
 - The author's mark, at the frame inset. Its geometry belongs to them.
- The clip tab
 - Drawn because a slide is broken. It leaves when the slide is fixed.
- The legibility tab
 - The type-floor alarm, one row below the clip tab.

The first two stay. The last two berth under the bar.

Quarterly program review for the regional distribution network and its downstream partners across four operating

Throughput

Median order-to-dock time fell from 41 hours to 26 hours.

Cost

Unit handling cost is down 12% year over year.

The corner had four claimants and the engine owned three.

Every earlier fix asked how far the marker should drop to clear whatever was above it. That question was answered wrong four times — once by pushing 21 class names a fixed row when the shapes sat at three different heights, once by a unitless `calc()` that discarded the whole transform, once by a reserve that landed the tab inside the mark it was written to clear.

Two of the four claimants are transient by definition. Moving those two stops the arithmetic instead of re-deriving it.

Fourteen shapes, and one of them still has to be cleared.

- Anchored right
 - `tab`, `flag` and `pin` at the corner; six more sit lower. None reaches the middle.
- Full width
 - `notch` is a hairline band across the top edge — the one reserve left, shown on page 4.
- Full bleed
 - `mark` and `veil` cover the tab on purpose, from the plane above.

Forgetting a reserve is now safe for every shape that does not cross the middle.

TWO OCCUPANTS · ONE RESERVE

The band under the bar is empty by construction, and that is why it was chosen.

The stamp used to reserve a row, which landed the clip tab at y 23–46 inside a mark occupying y 24–75, opaque, cutting the top off the logo. A slide pads `6.875cq̇i` at the block start, so nothing in flow can paint in the band below the bar — and `top: 0` resolves against the padding box, so flush stays flush with no token to keep in step.
