

AUTO-SPLIT • THE FOOTER CELL

The band a run needs

A run is not a slide

A run is not a slide

- A standalone sovereign slide claims the canvas
 - It suppresses the footer band on purpose: one statement, and no furniture around it.

A split run is multi-page →

A run is not a slide (cont.)

- A split run is multi-page
 - It cannot be read without wayfinding — which page is this, and is there more to come.

The marks belong in the band, not nailed to the section that happens to hold them.

the forward pointer

Docked, never appended

Without the Cell the pointer was appended to the section, and on this layout the section is the panel row itself, so the mark became a third column and squeezed the content panel.

The marks belong in the band, not nailed to the section that happens to hold them.

the forward pointer

The band is reserved on the section

That is what makes the content panel end above it, which is what makes content exceeding the panel read as ordinary overflow the engine already measures.

The same band, a different sovereign layout

The claim the ledger supports

The same band, a different sovereign layout

Before this change

The forward pointer floated in the middle of the slide, far from the rail and the number, because the layout had no Cell for it to dock into.

The same band, a different sovereign layout (cont.)

After

All three marks read as one line at the foot of the page, in the band.

What did not change

The caption rule →

What did not change

- The caption rule
 - A run's own `_footer:` is still said once, on the page that opens the run.

What did not change (cont.)

- The page number and the rail
 - Both still ride every page; they simply have a home now.

POINTER • RAIL • PAGE NUMBER

One Cell,
three marks
