

ROADMAP · HORIZONS · PORTRAIT · 2026-06-19

A roadmap that reads down the page.

A roadmap is a wide grid — workstreams down, phases across. On a tall deck those columns crush. So portrait picks the form the engine already had: the phase cards, stacked into one column you read top to bottom.

Same table, the right shape for the box.

You author the same workstream × phase table. The kernel reads the deck's orientation and, on a tall box, transposes it to phase cards and stacks them — no second authoring.

- **Phases become cards**, each carrying its workstream rows.
- **Cards stack** down the page; the header collapses to one line and each row reads `LABEL · value` so three or four phases fit.
- **Landscape is untouched** — the wide table renders exactly as before.

Every chart now meets the box where it is.

Funnel, the keyed dials, the gantt, the state machine, the journey, and now the roadmap — the whole family restructures for a tall canvas instead of shrinking into a band. A portrait deck is a first-class surface, not an afterthought.
