FEATURE DEMO · GANTT STATUS

"We pushed this" and "nobody said" are not the same bar.

`deferred` and an unstated task both take the family's neutral ramp, so no re-shading can separate them. The key now names the neutral, and a deferred bar carries a dashed edge — a cue read off `data-s` rather than off the color.

Two neutrals, and the key named one.

`Org-wide log` has no status; `CSV retirement` and the `Purge gate` diamond are deferred. Only `deferred` ever had a chip.

Dashed bar and dashed diamond are deferred; the solid bar nobody labeled

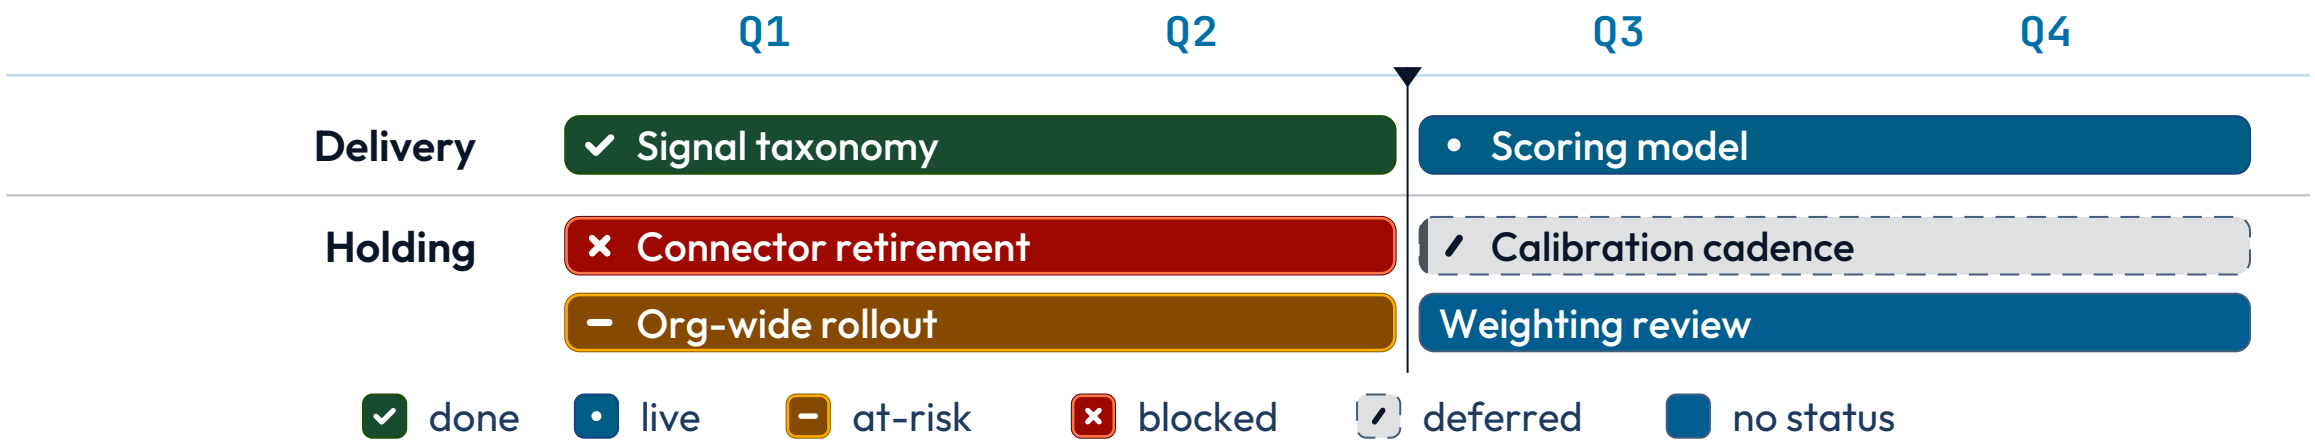

Read the key, then the bars.

The chip without a hue is `no status` — the bar nobody labeled. It appears only when a chart carries an unstated task *and* already draws a key.

- The dash, not a shade
  - `deferred` keeps its hollow body and gains `stroke-dasharray`. Opacity alone was 18% of a ramp that is already a pale tint — a difference to be hunted for rather than seen.
- The neutral has a name now
  - A chip with no status falls to the swatch's own neutral fallback, so it cannot impersonate a declared one. `unscaled` is deliberately not keyed: `lint:deck` already names that cause, and one chip carries one meaning.

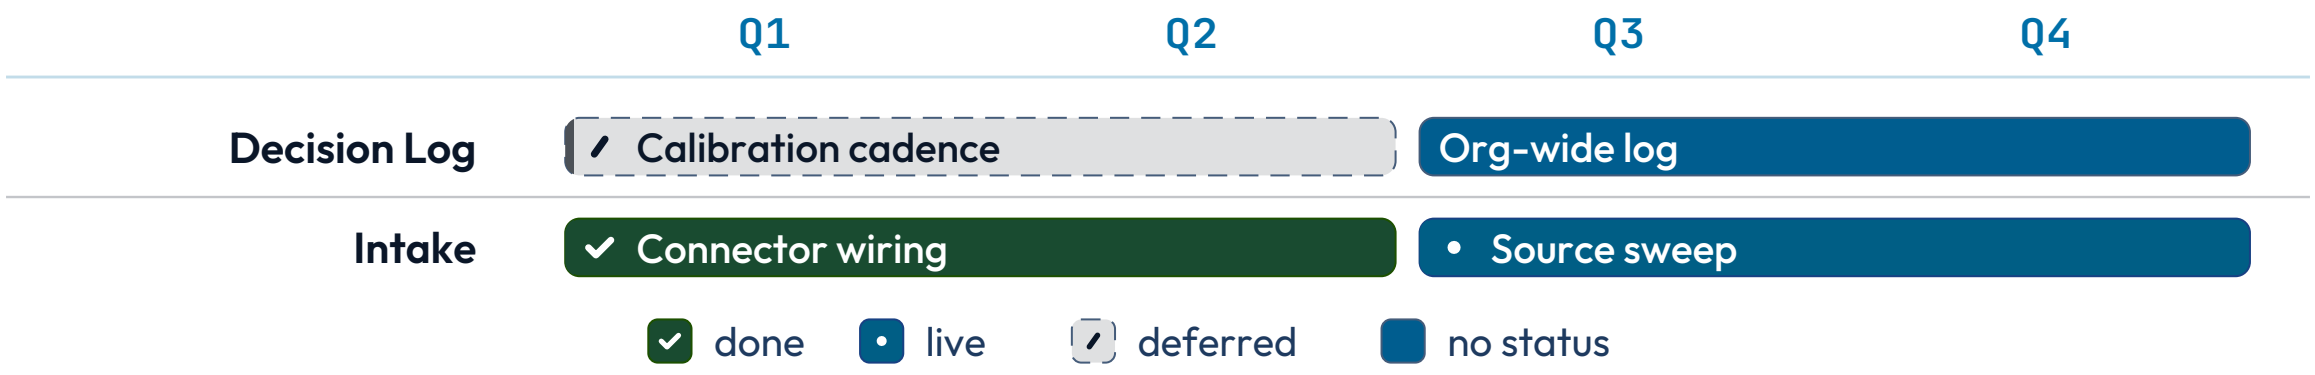

The full ramp, so the dash has neighbors.

Five ramps carry ten status words, so some share. A status and the absence of one must not.

Side by side in one lane is where the old cue failed.

Two bars on the same row, both neutral, one declared and one not. An 18% wash and a 1.67-unit accent sliver had to carry that; now the edge does.

What the dash is for, and what it is not for.

`deferred` and an unstated task resolve to the *same* mute ramp. Any channel chosen by ramp — hue, or a texture tile — paints them identically. They differ only in `data-s`, so that is what the cue has to key on.

- Not the accessibility channel
  - Under `section.print` and the a11y themes the engine textures filled marks, dashes stroked ones, and puts a shape glyph on any `.chart-status`. Gantt's statuses are bar fills carrying neither text nor glyph, so they reach none of the three — `#2274`, not this dash.
- Why the numbers are CSS pixels
  - Every gantt mark inherits `vector-effect: non-scaling-stroke`, which re-scopes the dash *array* as well as the stroke width. So `4 2.5` is 4px on and 2.5px off on a 480-unit landscape viewBox and a 300-unit portrait one alike — one physical pattern, not two.

#2255

Two marks on one ramp need a cue the ramp does not own.

"We pushed this" and "nobody said" share the mute ramp, so no amount of re-shading separates them. The dash does, because it reads off the status word rather than off the color.
