LABEL SETS · JOURNEY · THE POLES WERE AN ASSERTION

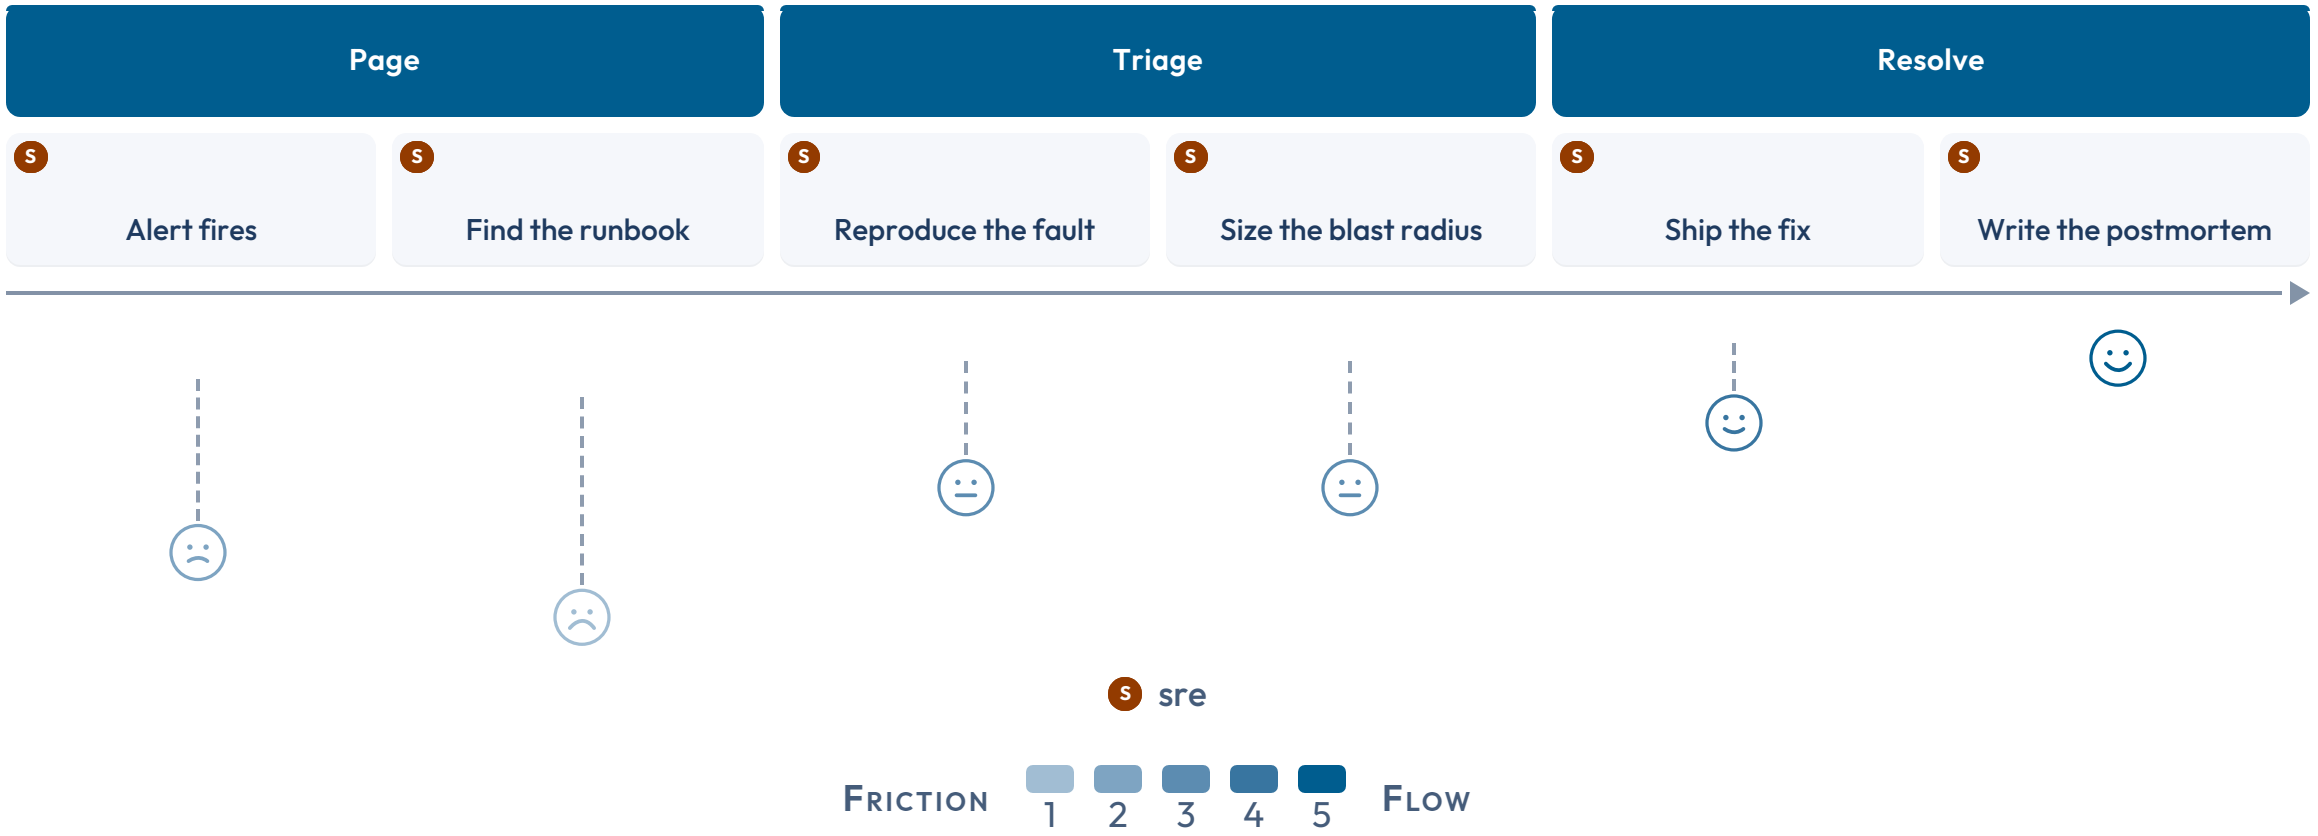

Not every scale runs from pain to delight.

The mood ramp's ends were two string literals, duplicated in both board builders. They assert a polarity the engine cannot derive — and the ramp decision record had already argued exactly that, about a different chart.

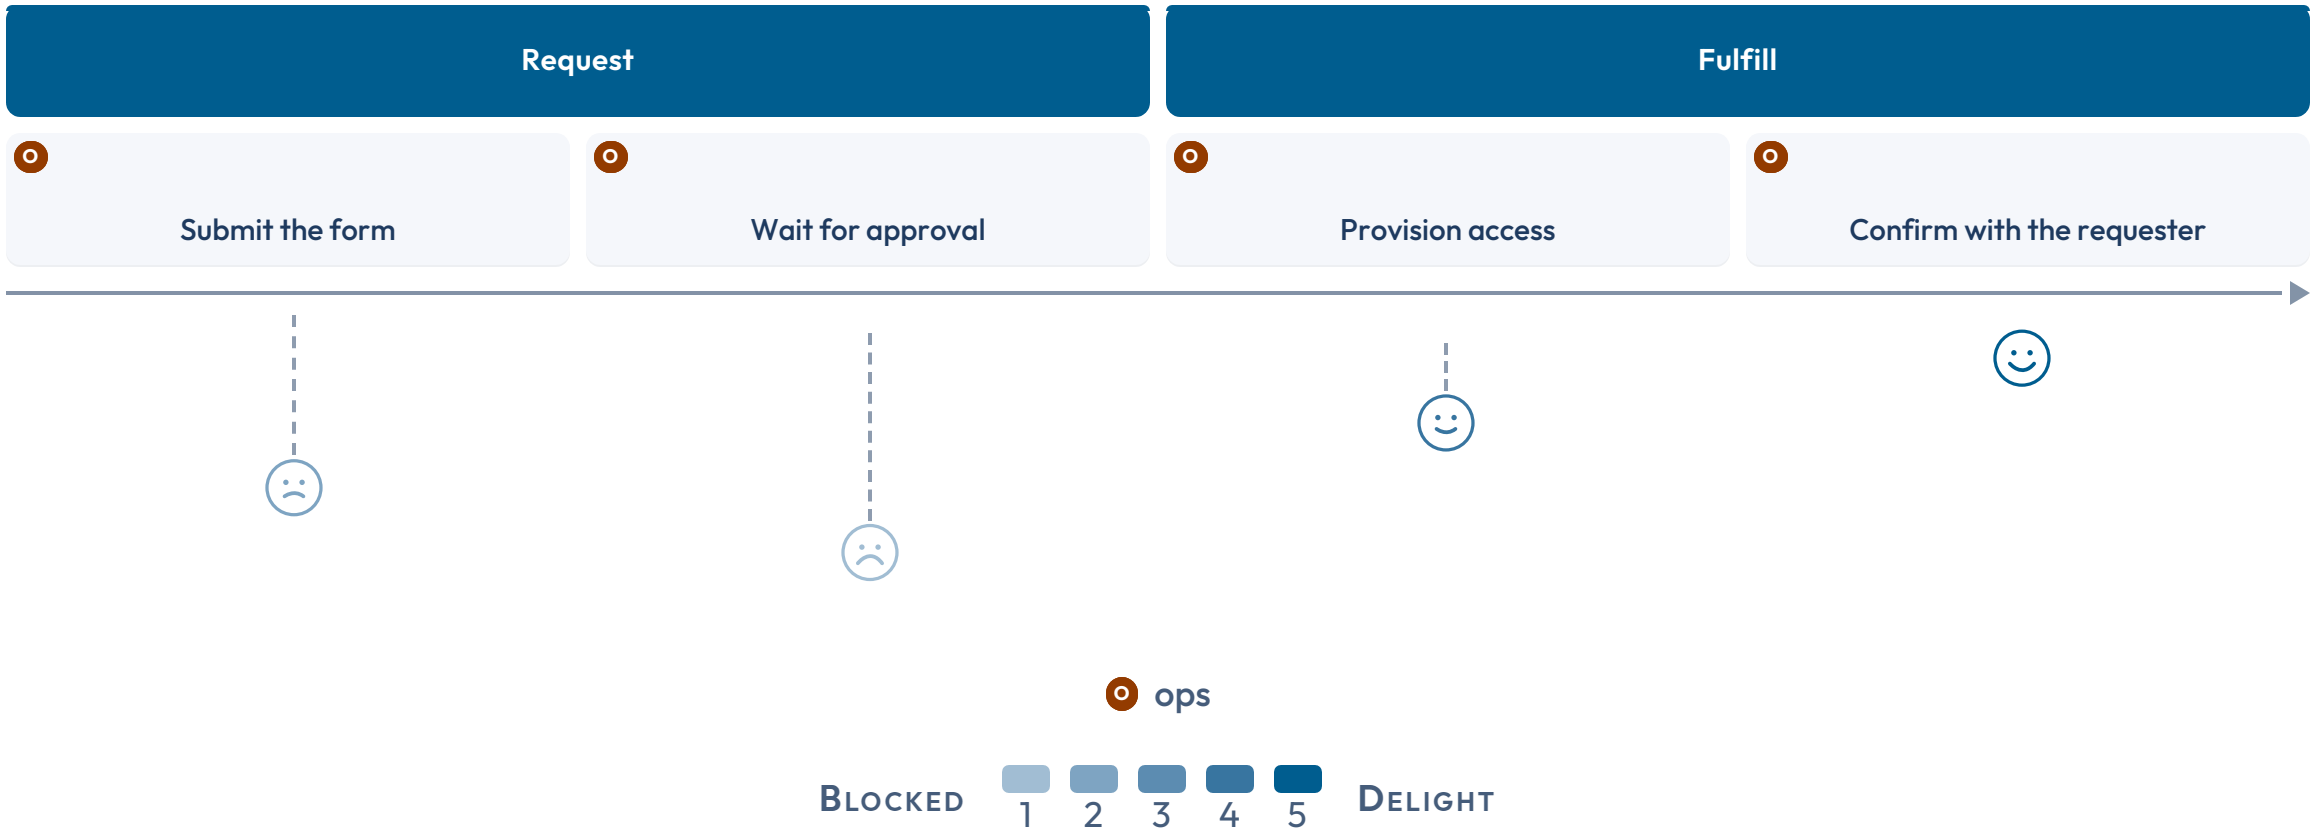

Onboarding, as a customer feels it.

The same board, for an engineer on call.

Naming one pole leaves the other alone.

Every variant gets the same key.

What changed.

- The poles are a default the manifest declares, not an assertion
- Naming one pole leaves the other on its default
- Only the two poles take words; the steps between carry their number
- The rename reaches the key's accessible name, so both agree
- One builder now, where the two board shapes each had their own copy
