FEATURE DEMO · KPI ROW RULES

A rule between the rows, never around them.

Five defects in one component, found by measuring rather than looking. The support rail bracketed itself with heavy outer edges, `compliance` drew a floor under its last row, its status pill declared a column it could never occupy, `spotlight` stranded the hairline that heads each number, and `trajectory` reserved a track its own recommended count never fills.

A separator earns its place between two rows.

- The rail used to open with a heavy rule above the first support and close with another below the last. Neither separates anything: they are the ledger's outer edges, and they turned three numbers into a closed table frame.
- `2026-09-03-table-outer-edge-rules.md` retired the same thing across the table family, and `inventory` had already dropped it from its own ledger citing that record. `kpi` never got the pass.
- Interior separators are unchanged — 1px `--border`. The heavy `--text-heading` weight existed only on the two edges now gone.

Revenue ahead of plan; margin and cash both expanded.

DATED – WATCH LEGAL

A rule that read as working, and did nothing.

- The row is a grid; the pill declared `grid-column: 3` and could never take it. The row's list is `display: contents`, so the inner items are the grid items and the pill lives inside one of *those* — a grandchild, which a grid cannot place.
- The declaration resolved and did nothing. The reserved track collapsed to zero and the pill trailed its label, leaving two-thirds of every row empty.
- The phantom track is gone, so the row is a truthful two-column grid. The pill still trails its text — right-anchoring it needs a wrapper element around the label, which is a DOM change rather than a CSS one. Two attempts to do it in CSS alone shipped here and were both reverted: each made every text run and inline element its own item, tearing an ordinary sentence apart.

spotlight promotes one number and rails the rest.

What the measurements said, and what they did not.

- **Compliance rows** declared a third column that resolved to 0px, so 65–67% of every row sat unused behind a rule that could never apply.
- **Spotlight** supports stranded their own hairline 37.3px above the number it introduces. Briefing already fixed this, at one count, explicitly excluding spotlight.
- **Trajectory** reserved a fourth 270px track, 23% of the stage, that a three-metric slide never fills.
- **One number was not a defect.** Trajectory's cards center their content 110.2px below a categorical stripe, which is a card edge rather than a rule heading a number — the same composition `ops` uses. Geometry alone could not tell those two apart.

The lead is a ceiling, not a taste.

- `0.12em` **is the most the rail carries with four metrics still fitting.** At 0.13em the slide above pushes 1.13px past the stage; at 0.14em the pill loses ink.
- **The overflow warning reports neither.** `overflow: clip` shears in silence. What sized this was the stage's bottom edge against the deepest descendant box.
- `tall` **and** `strip` **get no lead, and the reason is capacity.** A lead there clips a dense four-metric portrait deck inside the documented `tall.soft: 4`.
- **Two drafts justified that exclusion by measuring the portrait ledger instead. There is no portrait ledger to measure:** `kpi` overflows a portrait box at two metrics, so the Fit Spine cuts it to one per page and a single row has no separator to cross.
