IMAGERY · CANVAS · PROSE

# scene

An Anima motion scene as its poster still — an inline, palette-blind SVG that recolors with the theme and bakes crisp into the PDF; the live animation plays in the HTML/present surfaces.

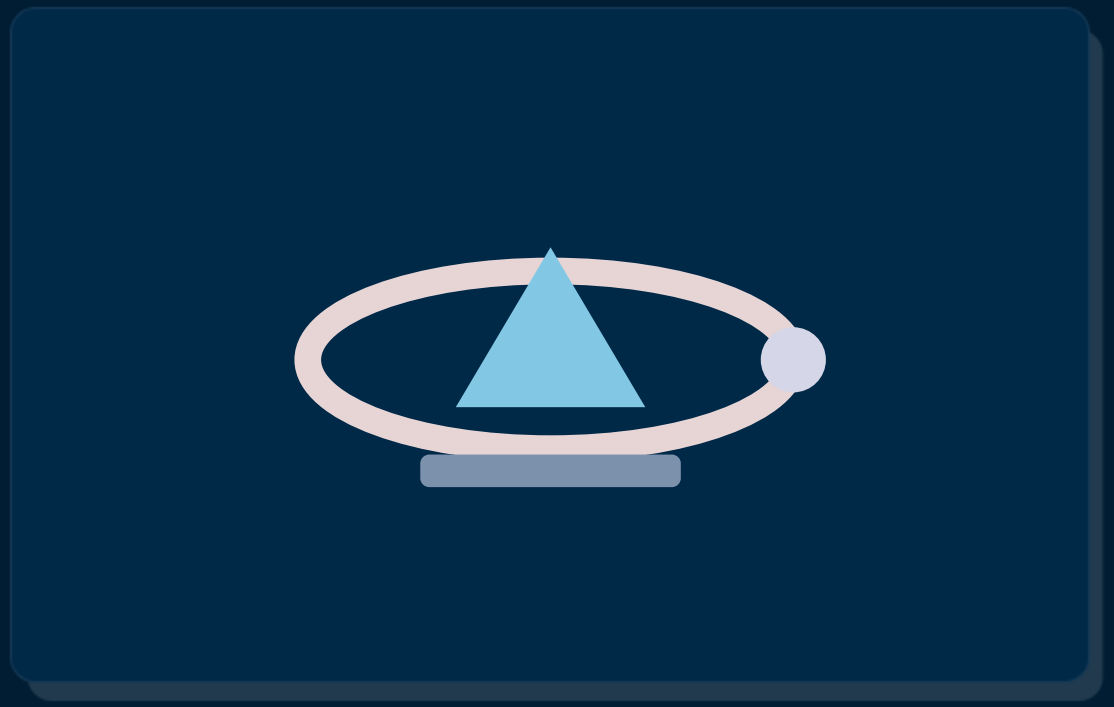

## The rotor spins inside its fixed housing.

The poster freezes the hero frame; on screen the rotor turns and a bead traces its ring.

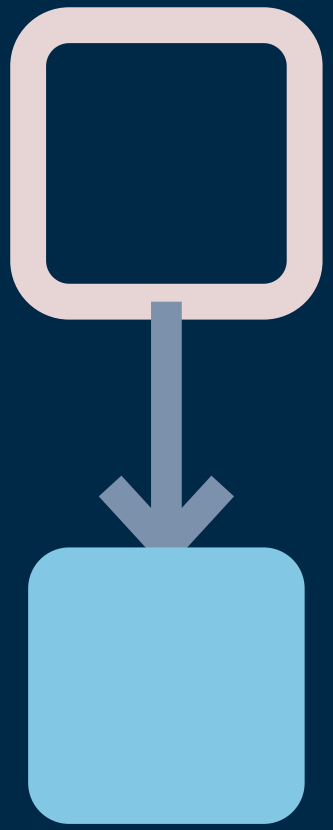

## clean seats the scene beside its claim.

The still floats in a card; the argument runs alongside.

# split gives a tall scene its full column.

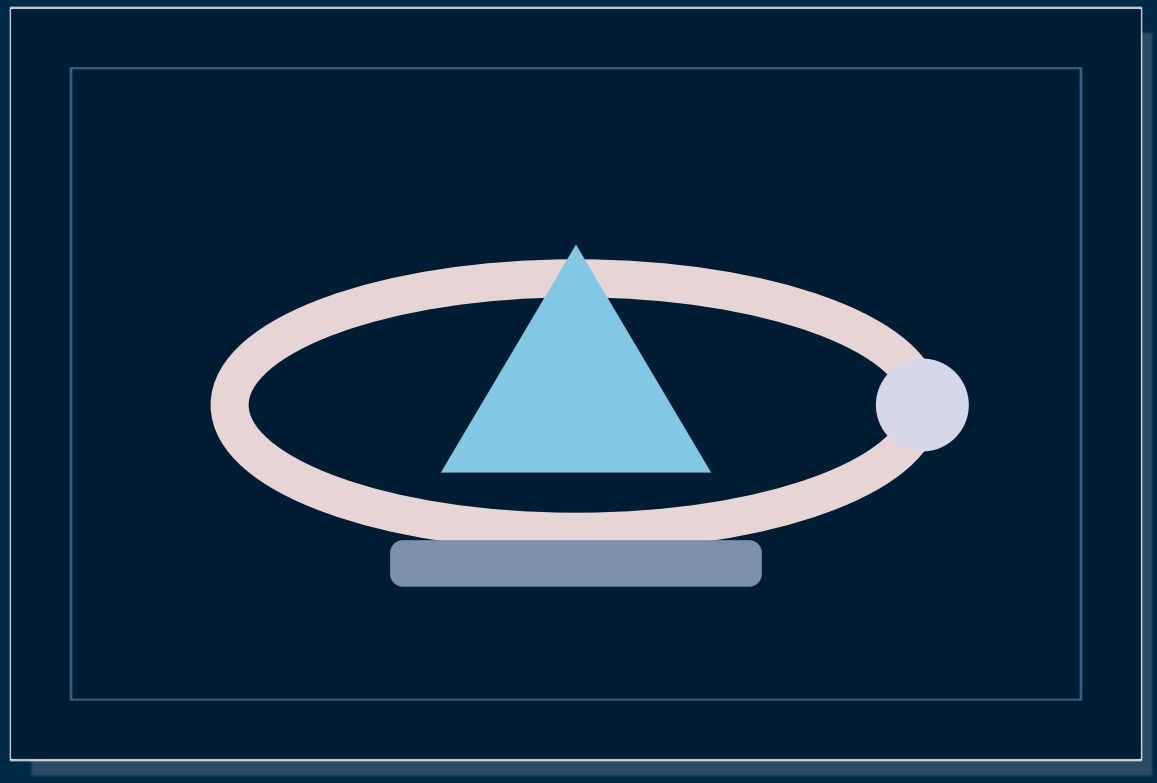

A portrait scene wants its height; the claim leads beside it.

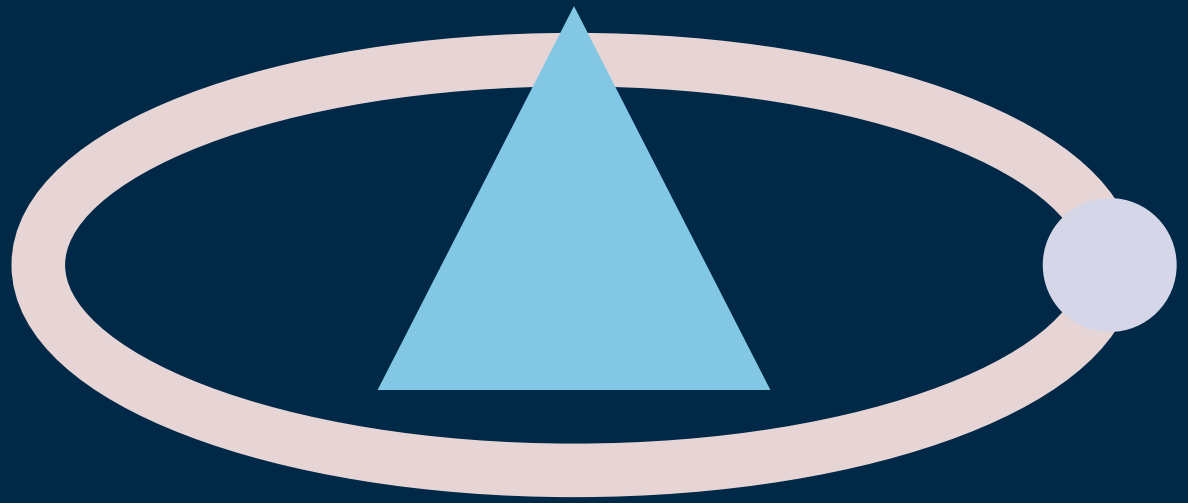

## spotlight lets a wide scene carry the slide.

When the scene already matches the canvas, let it own the frame.

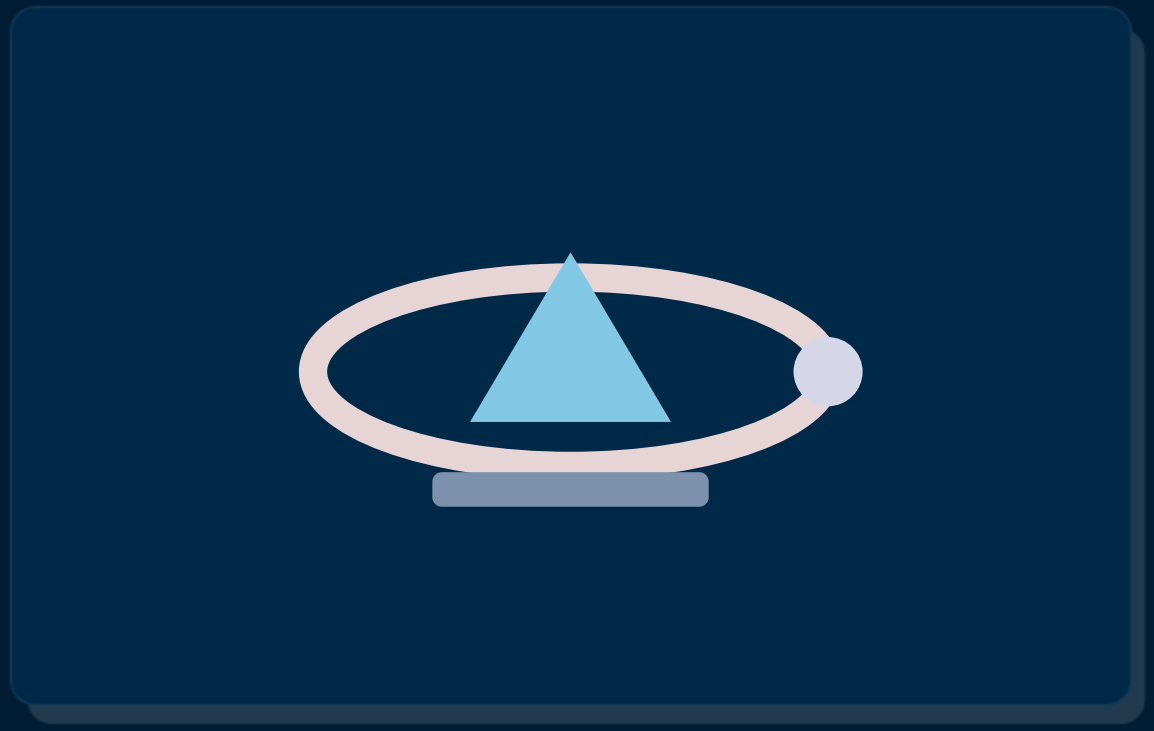

**gallery mats the scene like an exhibit.**

The whole scene on a matte — the default when the shape is the point.

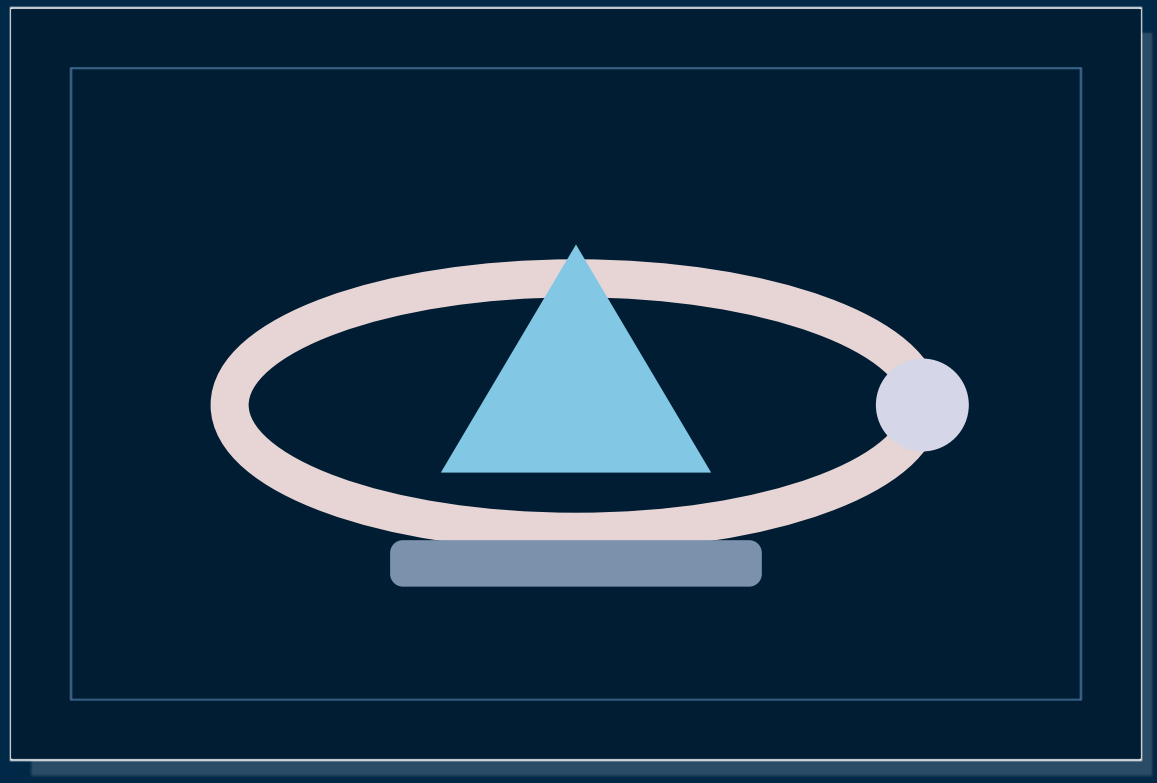

## statement rides the title below the scene.

The still sits on a matte stage; the title rides an editorial band beneath it.

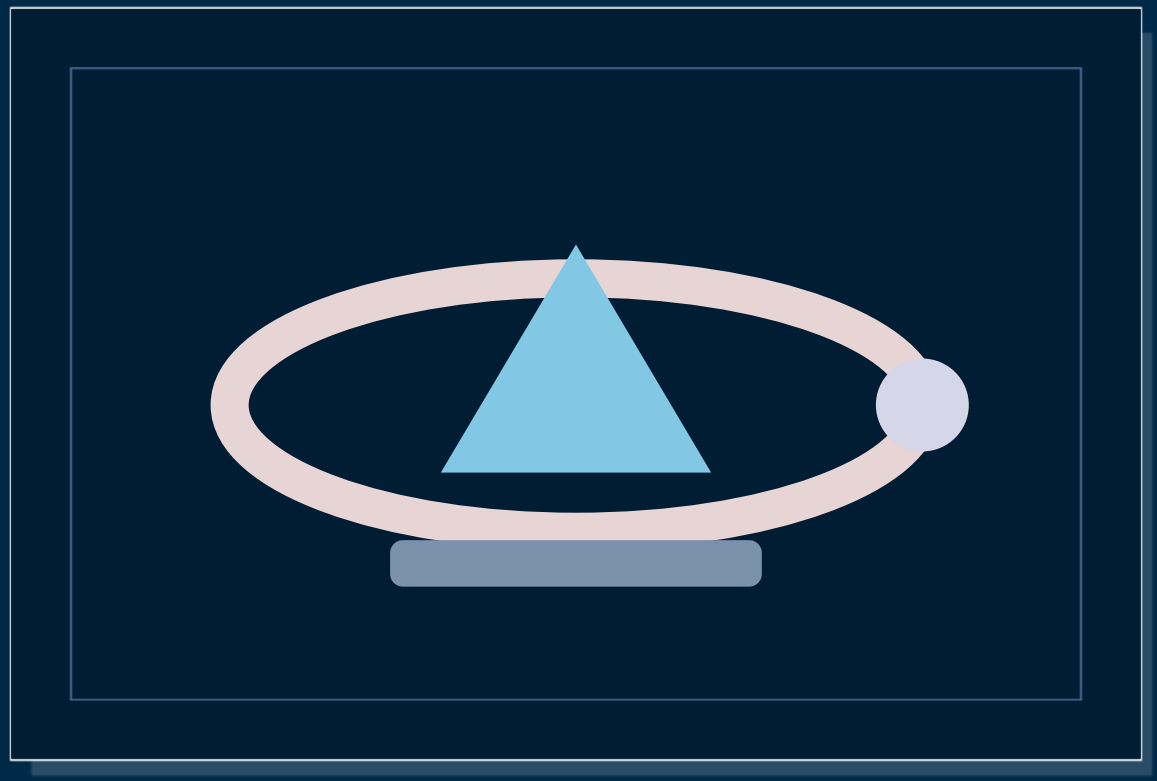

## mirror lands the scene on the left.

Scene anchors from the left; the text leads from the right.

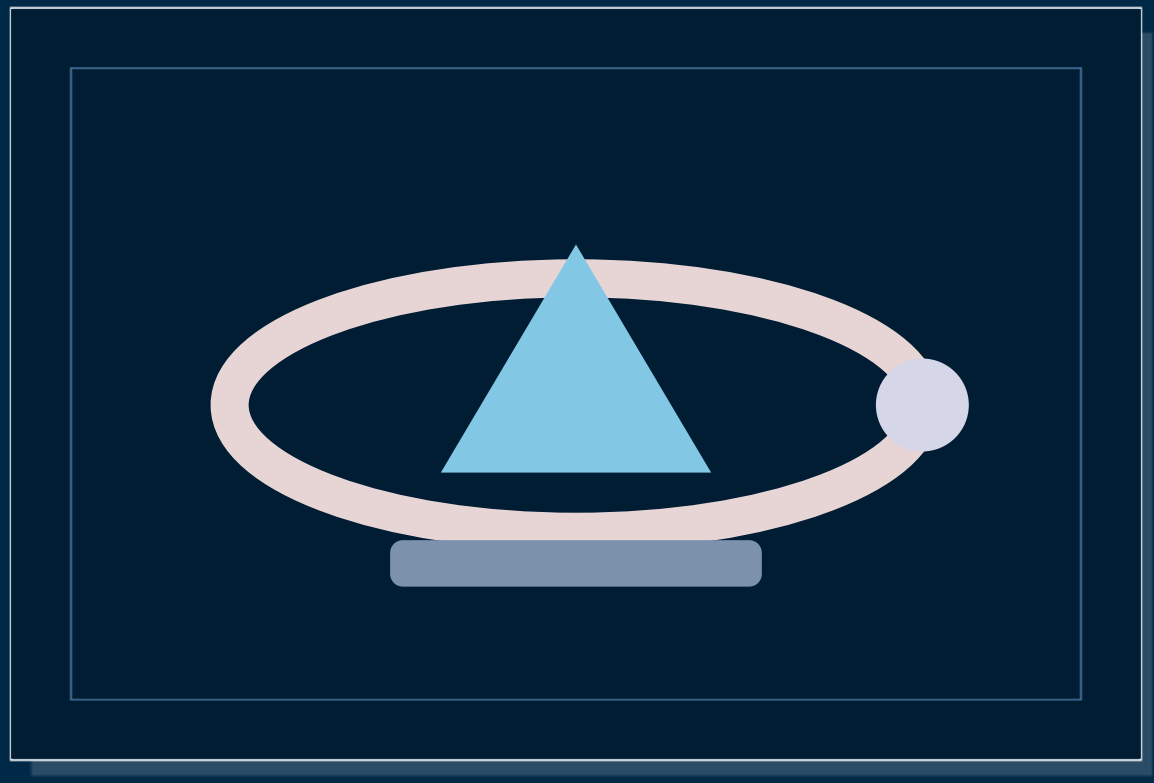

## The rotor spins inside its fixed housing.

The poster freezes the hero frame; on screen the rotor turns and a bead traces its ring.

## The rotor spins inside its fixed housing.

The poster freezes the hero frame; on screen the rotor turns and a bead traces its ring.

## The rotor spins inside its fixed housing.

The poster freezes the hero frame; on screen the rotor turns and a bead traces its ring.

# When NOT to reach for scene.

### Motion as decoration

If the animation doesn't carry information a still can't — a spinning logo, a bouncing shape — it's ornament. Drop it and use `image` or `diagram`. `scene` is for motion that argues.

### Expecting the PDF to move

A PDF is paper — it shows the poster still, not the animation. If the turning IS the point for a print hand-out, choose the hero frame that reads best on its own; the live motion is for the HTML/present surfaces.

### A photo or screenshot

If the visual is a raster still that never animates and never recolors, it's an `image`, not a `scene`. Reserve `scene` for the palette-blind, motion-bearing vector still.

RELATED COMPONENTS

# See also.

`image` — the visual is a still photo or screenshot, not an animated scene

`diagram` — a static Mermaid graph says it — no order or depth that needs motion

`video` — the motion is recorded footage with a provider, not a fabricated vector scene
