Lattice · Feature deck

Page numbers that name their section.

A filled agenda prints where each section starts, and only when every line still names it.

Three parts, in order.

01 Ship only after `npm test` p.3

02 What changed since the last release p.5

03 What we ask the room to approve p.8

Section 01

Ship only after `npm test`

The agenda you just saw kept every number.

The first section's heading ends in inline code, `npm test`

That code is part of the heading's name, not a page reference

So the line keeps its number, and so does every other line

Section 02

What changed since the last release

The same list, reordered by hand: no numbers.

01 What changed since the last release

02 Ship only after `npm test`

03 What we ask the room to approve

Why the reordered agenda shows no page numbers.

An exported deck carries the filled list and its `agenda-pages` marker

Reorder or rename a line there, and the count still matches

Each number would then point at the wrong section, so none print

Section 03

What we ask the room to approve

A number only where it names the section.

The filled agenda reads p.3, p.5 and p.8; the reordered copy reads none.
