Feature · auto-glossary

The deck that writes its own glossary.

Add `glossary: auto` to the front matter and the acronym registry's definitions become a reference appendix — on every surface, no extra authoring.

You already wrote the definitions.

The `acronyms:` registry (the one that teaches narration how to say `ARR` in full) carries an optional one-sentence `definition` per term. Until now it was stored and never shown.

The quarter in three numbers.

- ARR crossed the plan a quarter early.
- NDR held above target, entirely from expansion.
- CAC fell as the GTM motion matured.

Each acronym is defined once, at the back — so a first-time reader is never lost.

One switch, every surface.

`glossary: auto` in the front matter is the whole opt-in. Because it appends a real slide — built with the `glossary` component — the reference page ships in the PDF, the PPTX, the HTML player, and the live Studio alike. No per-surface work.

Boardroom restraint: define once.

The generated page lists each defined term alphabetically, with the runtime's auto range pill. An acronym with only a spoken expansion — no definition — is left off; there's nothing to define.

It also rides in the manifest.

Beyond the slide, the exported `.html` manifest carries the term-to-definition map, so a downstream tool can read your glossary without scraping the page.

The stored field is no longer dead.

The next slide is generated — you didn't write it.

Glossary

A – N

TERM	DEFINITION
ARR	Revenue a business can reliably expect to recur every year.
CAC	The average sales and marketing spend to win one new customer.
GTM	The plan for how a product reaches and wins its customers.
NDR	The share of last year's revenue kept and expanded, before new sales.
