What the editable export has to get right.

Pills, gradients, shadows, glass, wrapped code and a photo with a scrim. Open this as `.pptx` or `.odp` and try to move things.

Pills are pills

Each pill is one rounded shape with its text and dot, and its dot is part of the pill, not a loose picture.

Gradients are gradients

Two stops, 90°

Three stops, top to bottom

A fade from clear, 135°

Frosted glass and a tilted card

Frosted box: kept as its translucent fill, blur dropped.

A rotated card stays a picture.

Inline code, wrapped and not

Set `spectrum-trim: restrained` for a quiet rule, or `finish: atrium` for the wash. Each chip is a highlight on its words, so it moves and wraps with them.

A token too long for one line is cut mid-word, so this whole paragraph stays a picture: `a-very-long-inline-code-token-that-needs-to-wrap-onto-a-second-line-in-this-narrow-box` and then the sentence ends.

A dashed border is not a native shape yet: it stays in the picture.

A photo with a scrim
