A card tag can sit anywhere on its card.

Five placements and three alignments, on every tagged layout, set deck-wide by `tag:` or per slide.

tag-foot moves every tag to the bottom corner.

Owns the scoring policy, the calibration loop and the pager.

BUILD

Neither vendor exposes the calibration weights.

WHY NOT BUY EITHER

The competitive window closes in 18 months.

WHY NOT DELAY

tag-notch straddles each card's top edge.

1

Signal Intake

Weekly structured collection, one schema.

2

Scoring Model

Confidence, recency and relevance.

3

Decision Log

Every decision with its signals.

4

Calibration Loop

A monthly look at the weights.

A band may wrap to two lines, and every band matches it.

BUILD

Owns the scoring policy, the calibration loop and the pager.

WHY NOT BUY FROM EITHER SHORTLISTED VENDOR

Neither exposes the calibration weights to the customer.

WHY NOT DELAY

The competitive window closes in 18 months.

tag-inline sets the label above the text as a chip.

BEFORE

Every prioritization debate argued from first principles, average close four hours.

→

AFTER

Decisions resolve against logged weights, average close 18 minutes.

On list-steps, tag-corner boxes the step label.

STEP 01

Scope

Agree the boundary.

STEP 02

Build

Ship the kernel.

STEP 03

Verify

Diff every gallery.

STEP 04

Launch

Merge and announce.

tag-end sets the text at the far end of the band.

1

False signal amplification

One loud voice dominating the decision. The model caps any source at 30%.

2

Signal hoarding

Signals collected, decisions unlogged. Above P2, the log is required.

With tag-bare, a notch reads as a legend.

BUILD

Owns the scoring policy and the pager.

BUY

Neither vendor exposes the weights.

DELAY

The window closes in 18 months.
