chart family · 2026-07-27

Every label inside the drawing

The two chart labels that were still HTML — word-cloud's size key and radar's small-multiple captions — now live inside their viewBoxes. Both components flip from `render: hybrid` to `svg`, derived from the rendered export rather than asserted.

SIZE = FREQUENCY

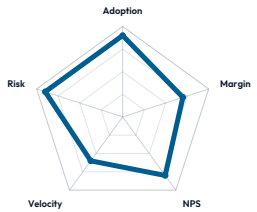

The key scales with the words it explains.

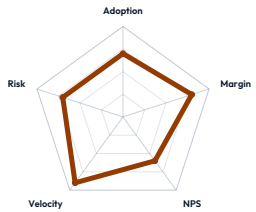

The size ramp used to be an HTML rail, sized from the slide's type scale rather than the chart's. Inside the viewBox it is locked to the cloud it explains.

Scale · 0–10

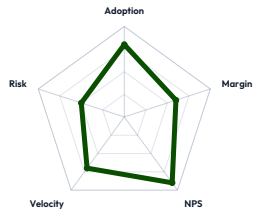

Four minis, four names, one drawing each.

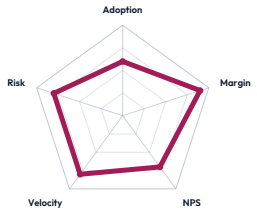

Atlas

Beacon

Cinder

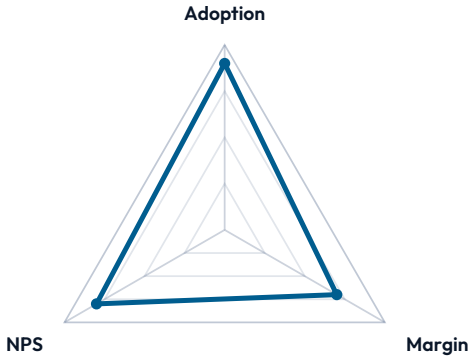

Drift

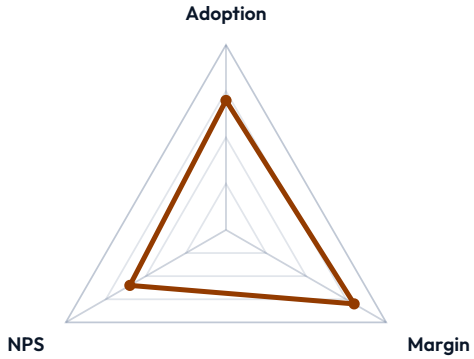

Exported on its own this used to be four unnamed shapes — the names were figure captions sitting outside the drawing.

Scale · 0–10

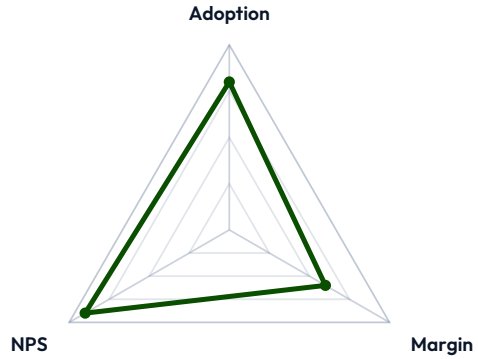

A wrapping name grows the band for all of them.

Northwind Logistics and Distribution

Atlas

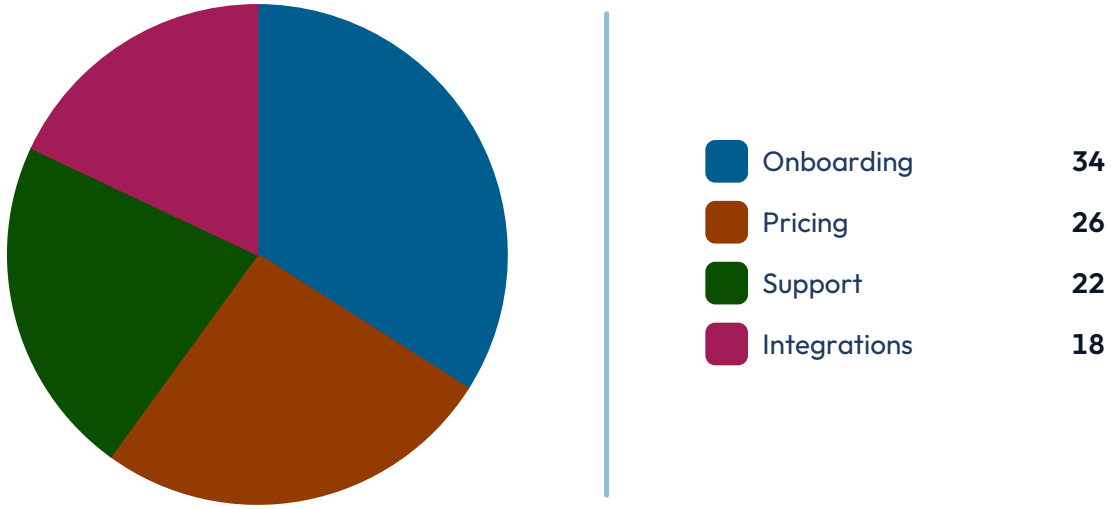

Beacon

The caption band is sized once per chart from the longest name, so the row stays aligned — and a chart of one-line names pays for one line, not two.

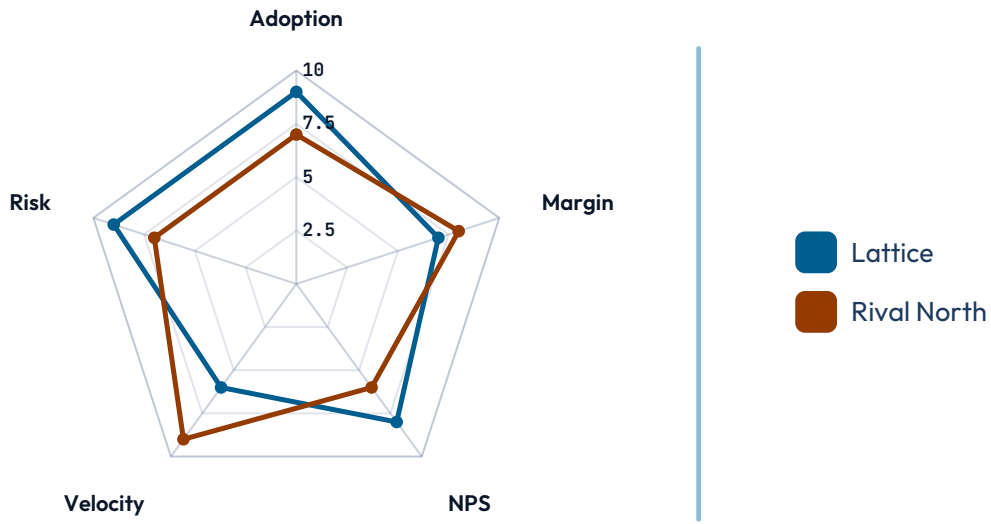

Q3 · effort split

The pie set the pattern: key inside, key below at portrait.

Diagram, spine and key in one viewBox, scaling as one unit. The word cloud now shares that spine builder instead of a third copy of the same gradient.

The single radar was never the problem.

Web, spokes, axis labels and legend were already inside the viewBox. Only the small-multiples captions had stayed outside — 22 characters of HTML.

What changed, and what proves it

`render` is derived, not claimed

`check-render-nature` renders each gallery through the export path and fails when the manifest disagrees.

Size-neutral where it was right, a fix where it was not

The caption still renders at 10.78px; at portrait the old HTML key had overflowed its own rail.

The stage-fit invariant now has a gate

`check-chart-fit` fails on the shapes that clipped, and passes here.
