Chart color · the spend

Hue has two jobs

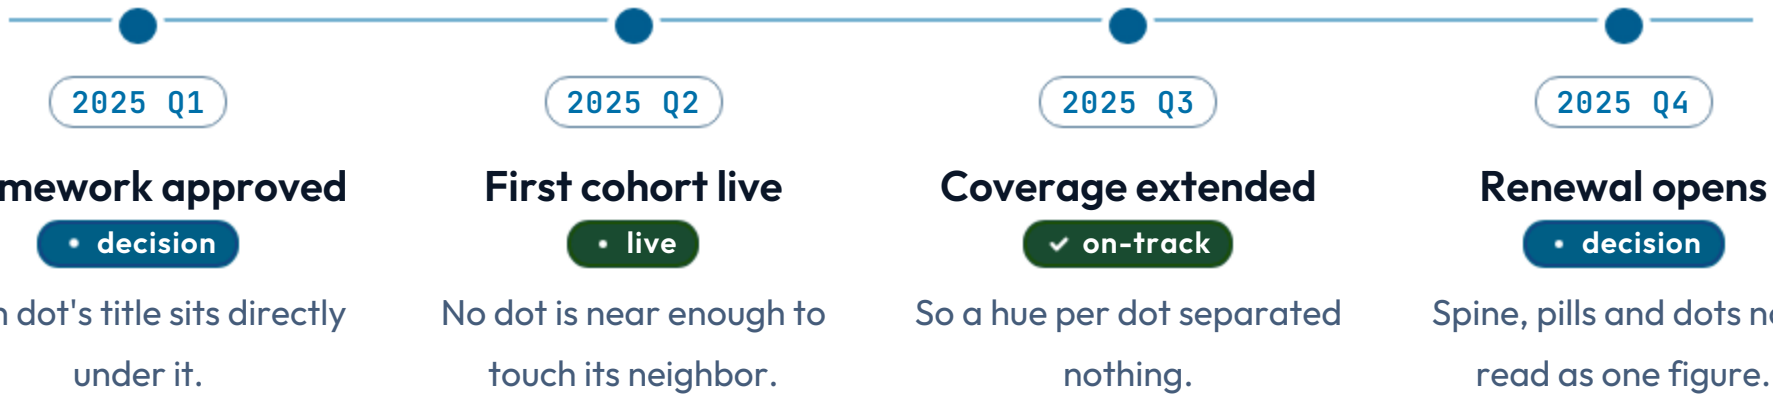

A categorical hue **binds** a mark to a name that sits somewhere else, or it **separates** marks that touch. A mark with its own label beside it and clear space around it needs neither — so `funnel` and `timeline-list` now draw in one hue instead of six.

The funnel narrows; the width is the story.

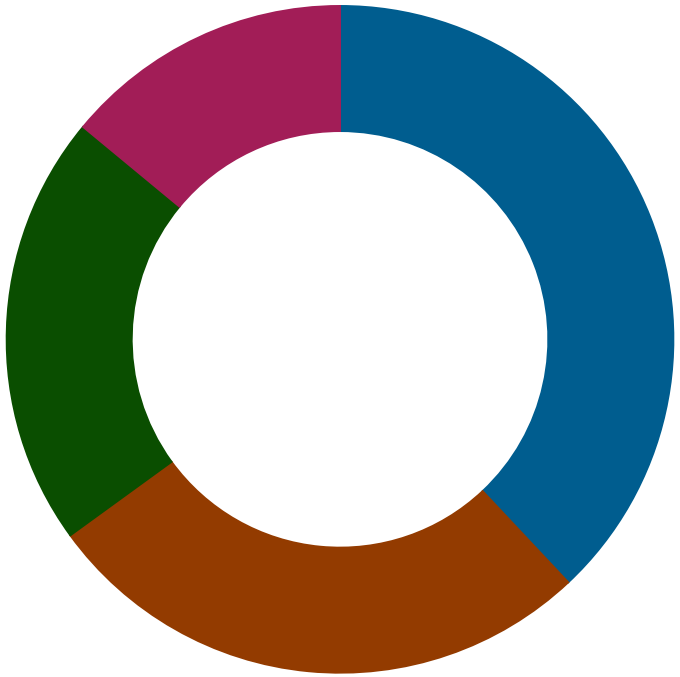

Milestones · one hue

The spine orders the events; the dates name them.

Bind · the legend rail

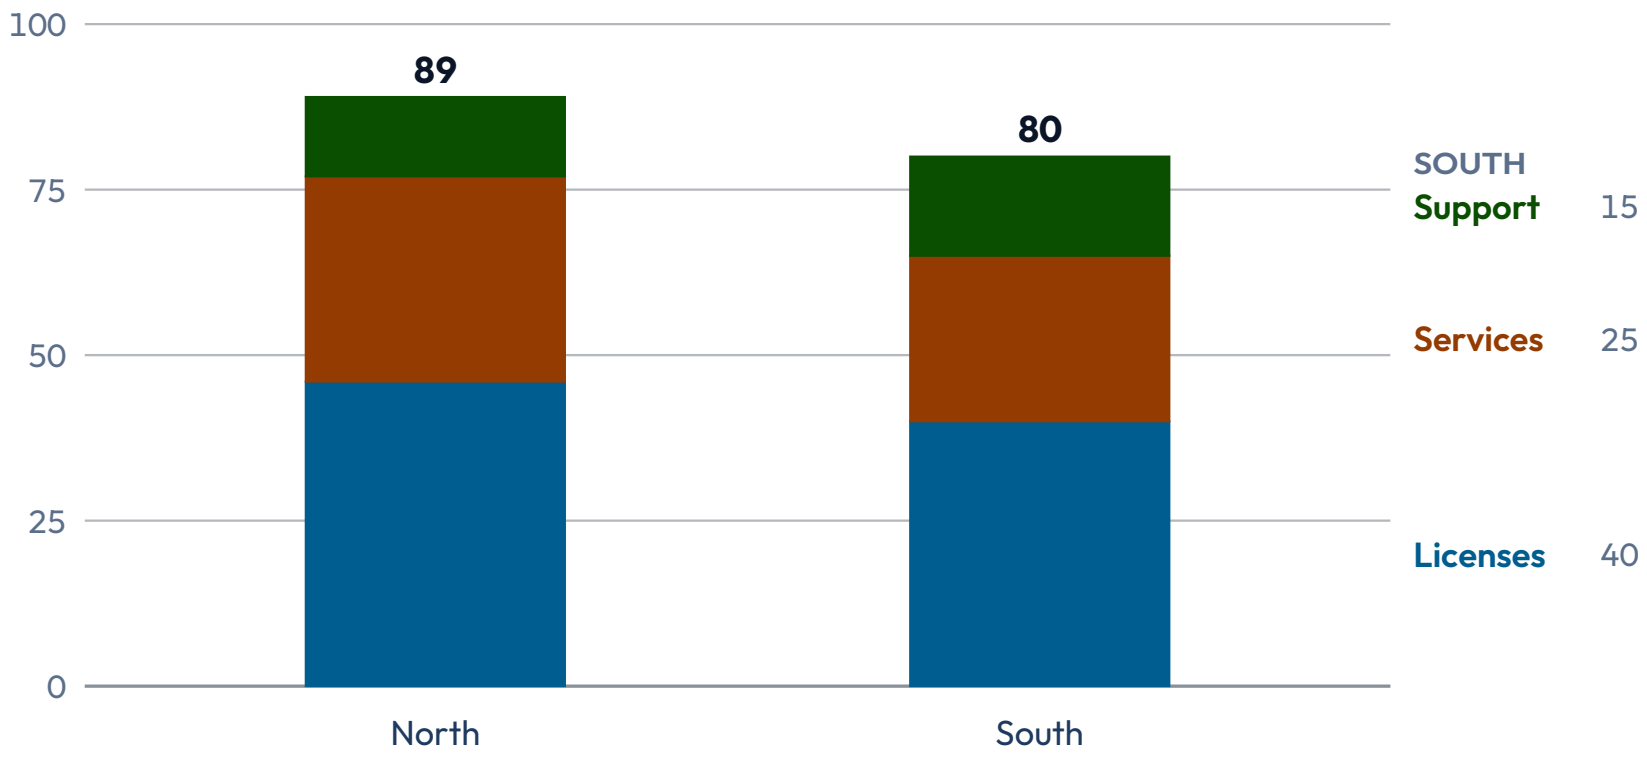

The key is not on the wedge, so hue carries the name to it.

Enterprise	38%
Mid-market	27%
Self-serve	21%
Partner	14%

Separate · segments that touch

The segments share an edge, so position cannot tell them apart.

The rule

Spend hue where it does a job.

Bind

The mark and its name are apart — a legend rail or a leader line.

Separate

The marks touch or overlap, so position cannot tell them apart.

Neither

One hue, slot 1; identity moves to the label already beside the mark.

Chart color · the two-jobs test

Six hues for six bands said nothing six labels had not already said.
