Lattice · icons in charts

A node can say what it is before you read it.

The flowchart and the state chart take the icons plugin's drawings: `icon=` beside the name, `icon-only` in its place.

System map

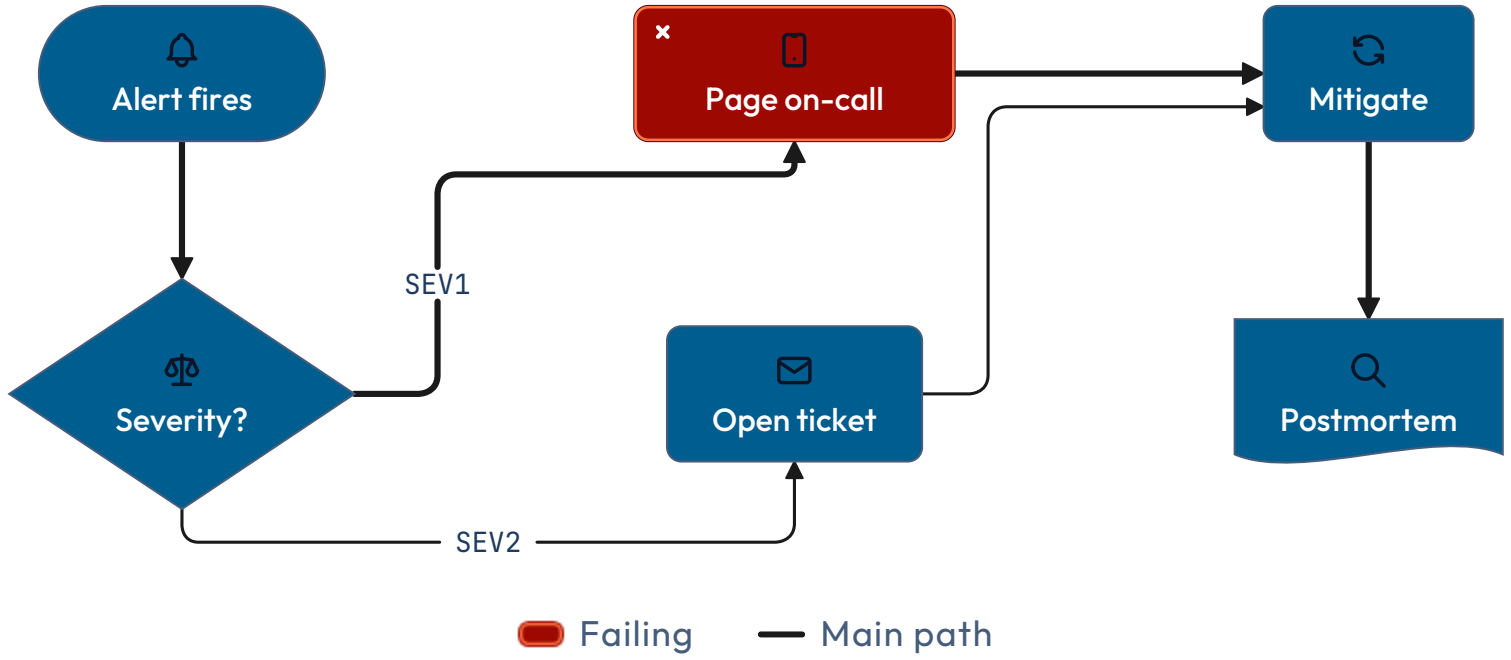

Uploads reach the warehouse in under a minute.

`icon=` sits before the name in a left-to-right chart. Inside a node the icon is bare, in the name's ink: the node is already the tile.

Paging

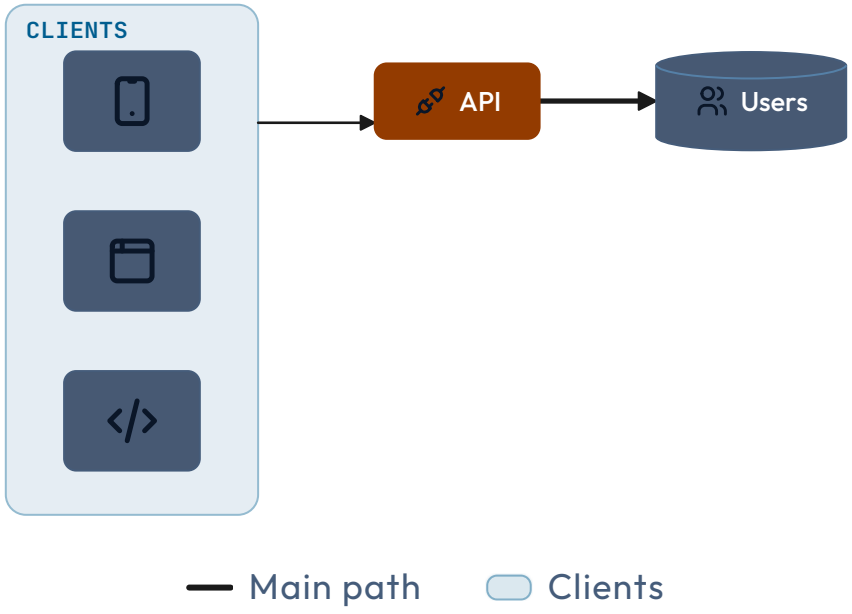

Every page reaches a human within 15 minutes.

Pinned `tb`, the icon sits above the name. The layout places it; the author only names it.

Clients

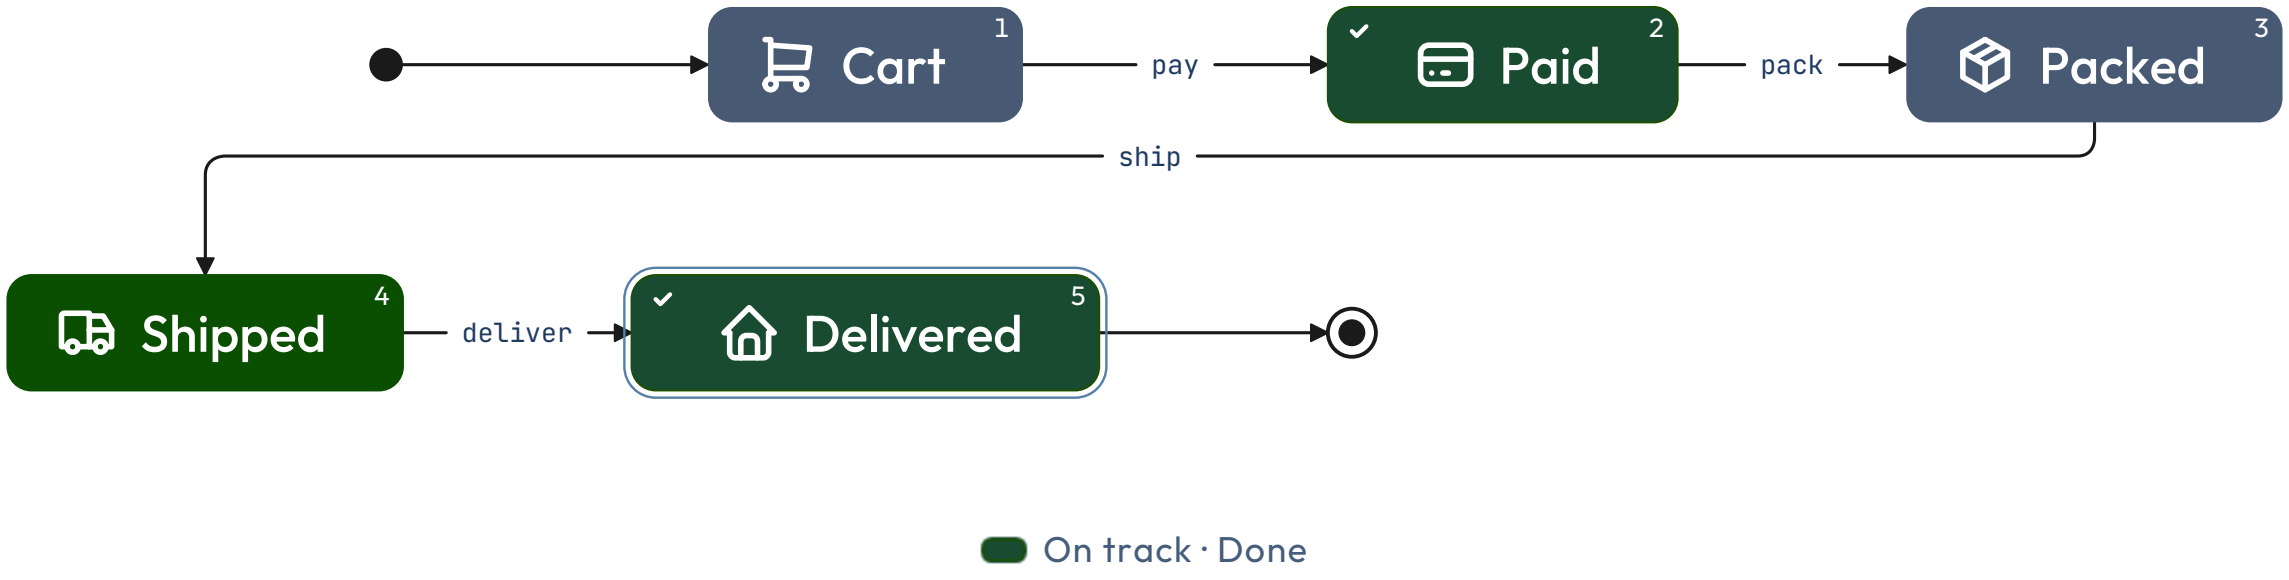

Three clients share one API.

`icon-only` draws the icon alone. The name stays as the hover title and as what a screen reader and the chart's description say.

Order lifecycle

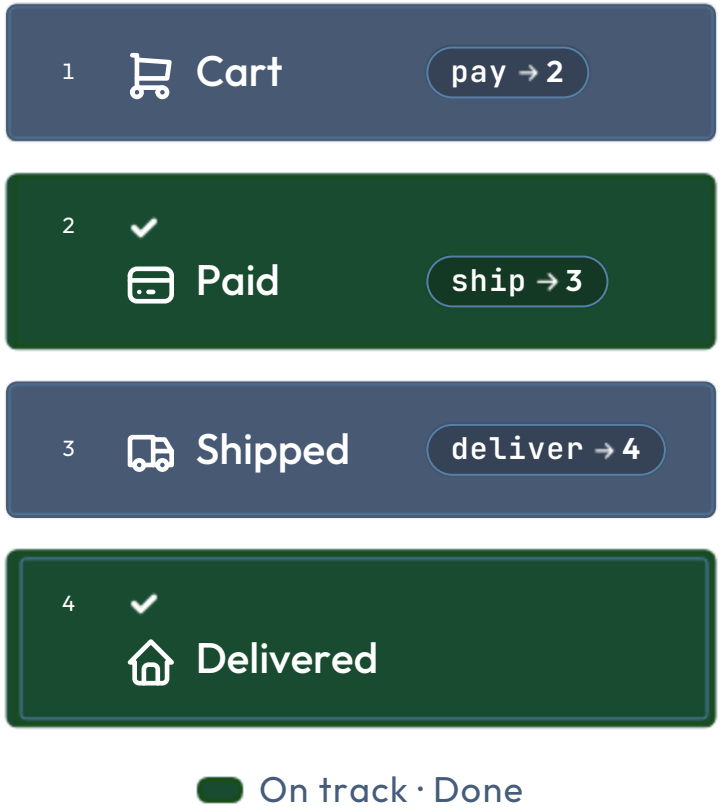

An order moves from cart to doorstep in four steps.

The state chart reads the same two words in the same record as its lead words and statuses.

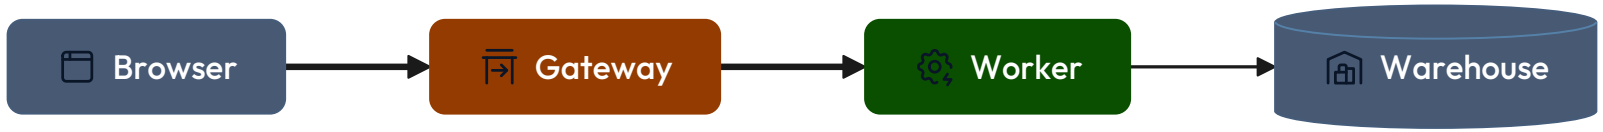

Order lifecycle

The inline rows carry the icon in the label.

Look

The deck's icon look still thins the line.

Main path

`icon-etch` on this slide (or `icon: etch` on the deck) draws every node icon at the thinner etch stroke.

A name that does not draw is coached, and the node shows its text.

WRITTEN ON A SHAPE ROW	`LINT:DECK` SAYS
`{icon=lambda}`	a service, not an icon: use `function`
`icon-only`, no `icon=`	names no icon, so it shows its text
`{icon=database}` on a group	a group's title draws no icon
`{icon=database, icon-only}`, no name	no name: keep the words

With the icons plugin off, every node shows its name, exactly as if no icon were written.
