Feature demo · containment tier

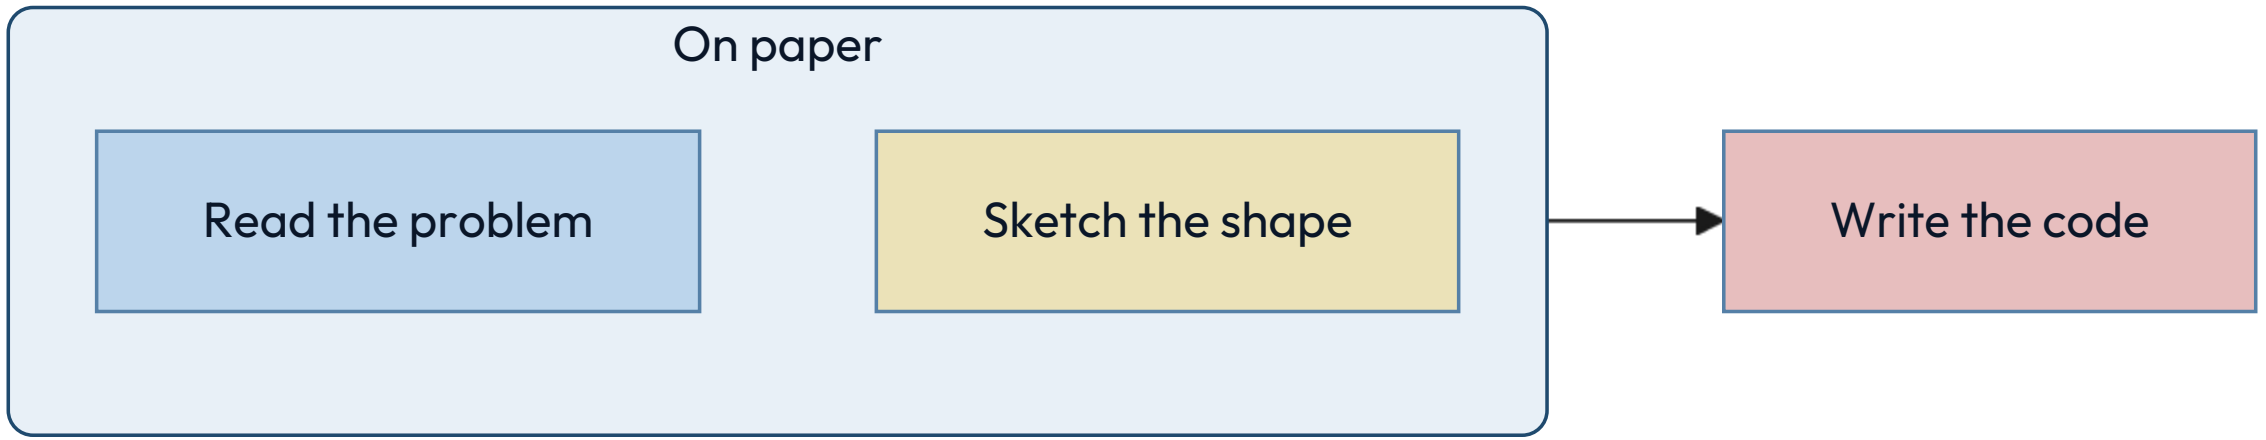

A group box you can actually see, in every theme.

A subgraph is drawn from three per-theme tokens now — fill, edge and ink. Before, the fill borrowed the deck's card color, the ink borrowed the categorical tier's, and the edge was a stroke that never flipped with the color scheme.

The three rungs

Fill, edge, ink — each curated per theme.

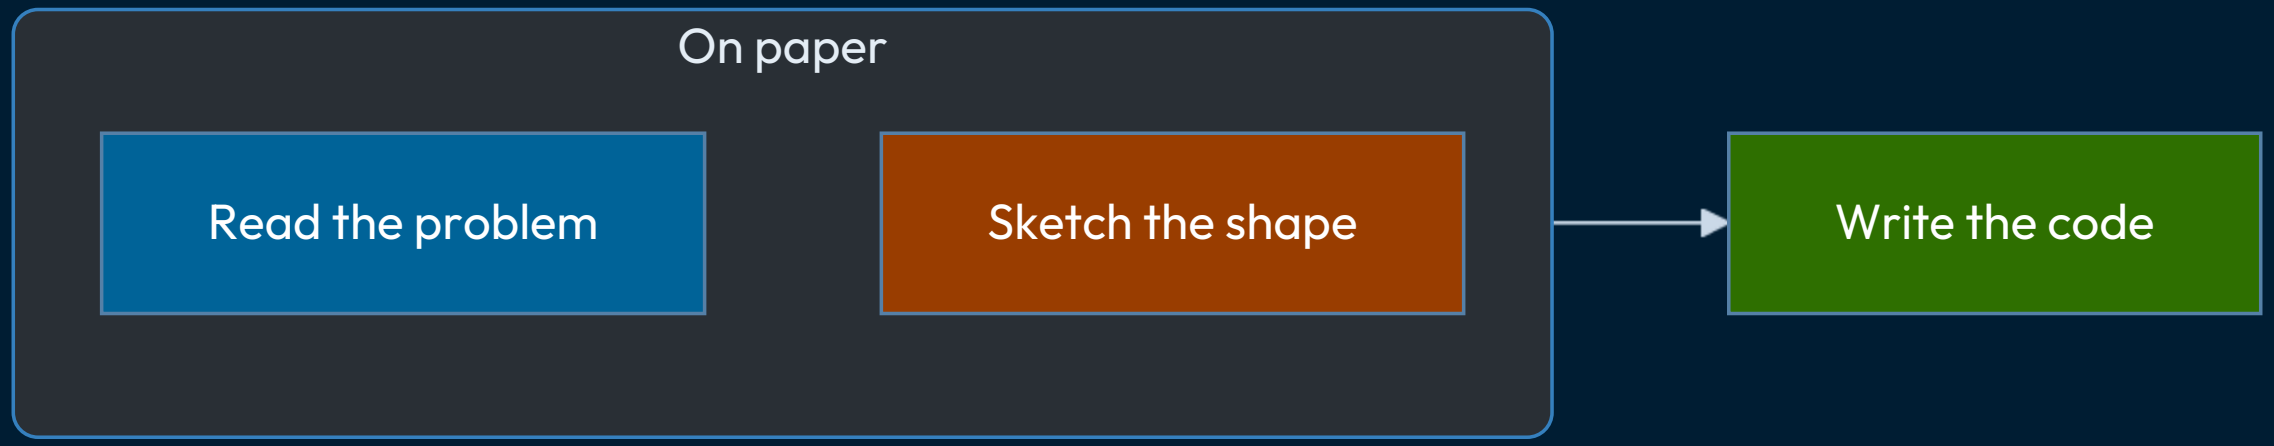

Each one a per-theme token, not a borrowed neighbor

The case that was broken

On a dark canvas the box used to disappear.

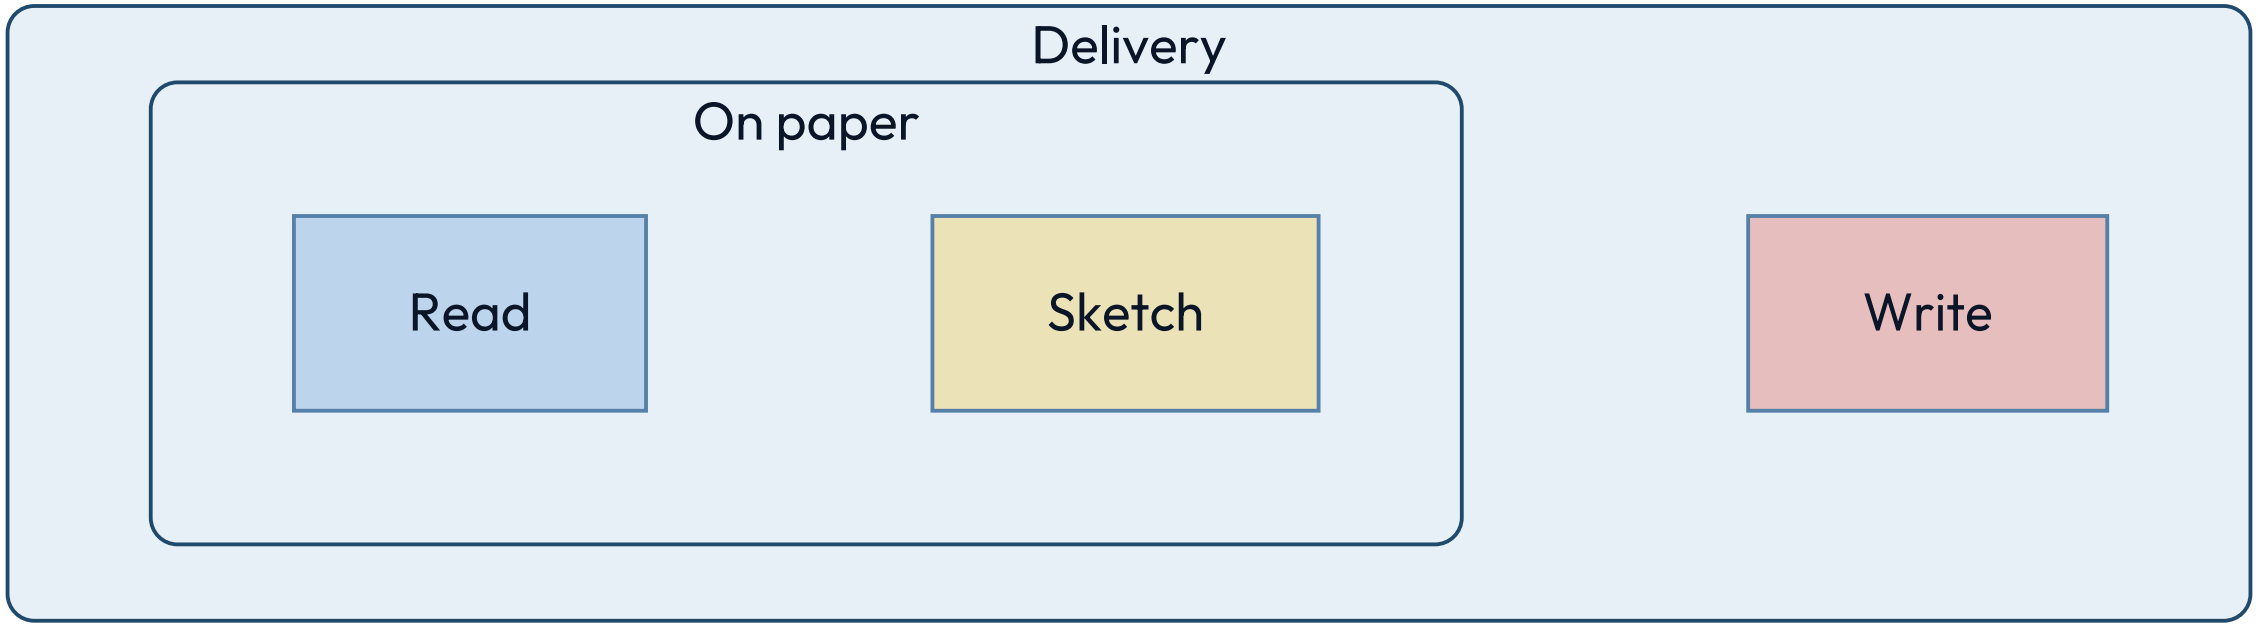

The fill is faint by design — the edge carries the grouping

Two rungs

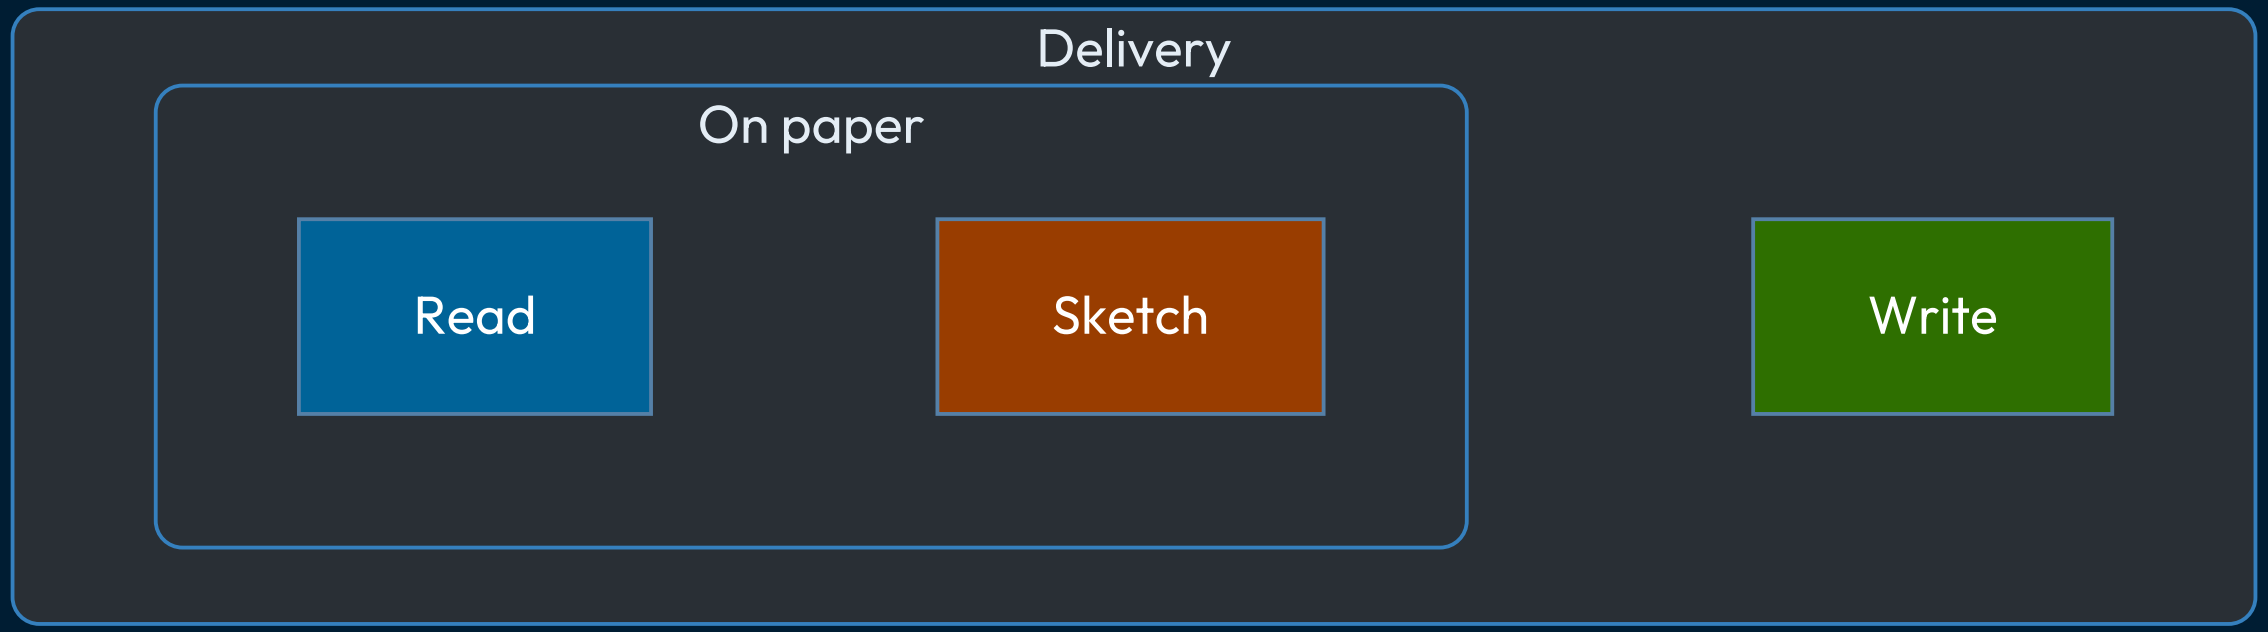

A box nested in a box steps once further.

The ladder never steps back toward the canvas

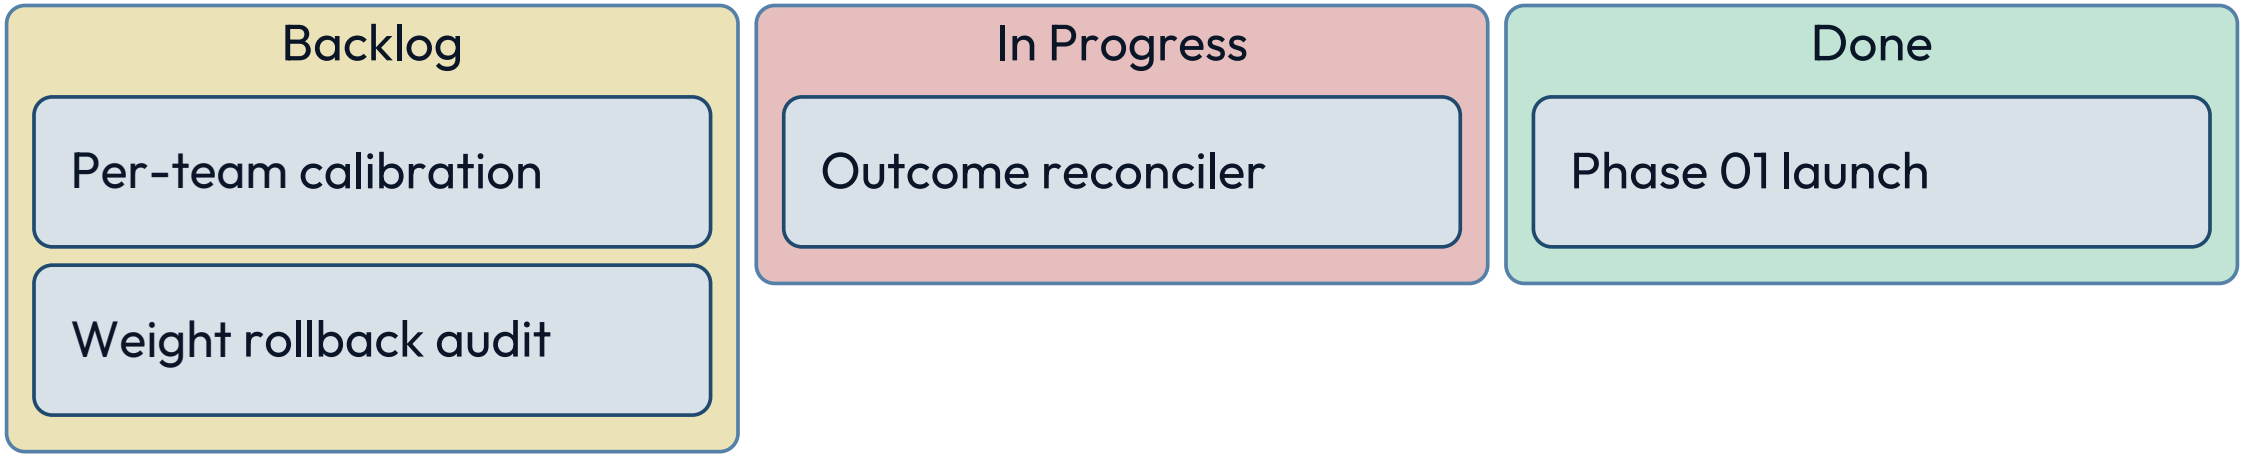

Two rungs, dark

The same ladder, inverted scheme.

The other consumer

A kanban ticket sits on the second rung.

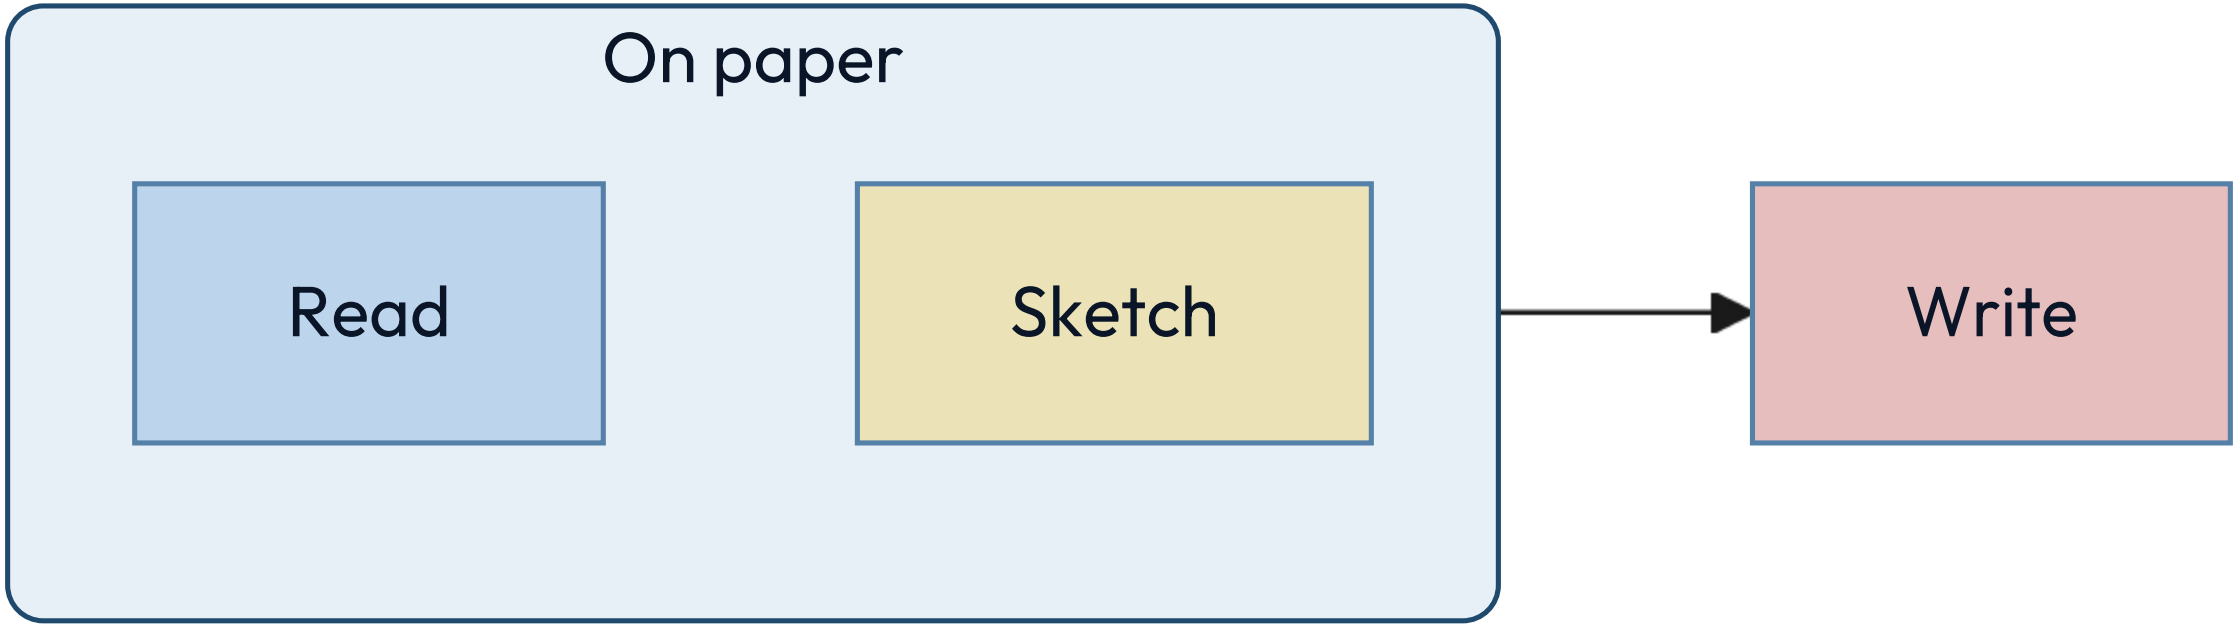

#1311

An init directive keeps the palette.

curve: linear applied; every color it did not name stays the theme's

---

What the gate holds

Legibility is asserted, not assumed.

Every theme, both schemes: ink clears 4.5:1 on the rung it sits on, and the edge clears 3:1 on the fill it outlines. Fifty-seven assertions, and a mutation check proves they fail when a value drifts — pale ink, an edge equal to its fill, or a ladder that steps backward each turn the suite red.
