The cycle component

Work that loops.

For the processes that have no beginning and no end — only a turn that feeds the next.

The build–measure–learn loop

Every product decision is a lap, not a line.

Build

Ship the smallest change that tests the idea.

Measure

Watch what real users actually do with it.

Learn

Turn the signal into the next thing to build.

A cycle is not a timeline — reach for it when the end feeds the start.

Use `list-steps` when a process has a real beginning and a real end: onboarding, a launch checklist, a migration. The number promises that order.

Use `cycle` when the last stage hands off to the first and the loop is the point — a feedback loop, a season, a flywheel. There is no "step one"; there is only the turn.

The content flywheel

Attention compounds when the loop keeps turning.

Create

Make one thing worth someone's time.

Publish

Put it where the audience already is.

Distribute

Let others carry it further than you can.

Engage

Answer, and mine the replies for the next Create.

The water cycle

The same shape runs the natural world.

Evaporation

The sun lifts water from ocean and leaf into vapor.

Condensation

Vapor cools into cloud, a reservoir held aloft.

Precipitation

Rain and snow return the water to the ground.

Collection

Rivers gather it back to the sea, and it begins again.

The carbon cycle · five stages, the comfortable ceiling

Five stages is about as much as a ring holds and stays legible.

Photosynthesis

Plants pull carbon from the air into sugar.

Respiration

Living things burn sugar and breathe carbon back.

Decomposition

Decay returns carbon from the dead to the soil.

Combustion

Fire and fuel release stored carbon at once.

Storage

Ocean and stone lock the rest away, and the wheel turns.

Keep it to three–six stages, one clause each.

Under three, there is no loop to trace. Past five, the ring crowds and the descriptions shrink below reading size — move the detail to `list-steps`, or split the loop across two slides.

Each stage is a short name and a single clause; the arrows carry the sequence, and the return arc closes it.

A line ends. A cycle compounds — so the work goes into the turn.

Find the loop, and you find the leverage.
