Deck mark · the canvas decides

The logo reads on every canvas

A `logo:` mark is a monochrome watermark, so it needs the **opposite** treatment on a dark ground from a light one. Getting that wrong does not error — the mark renders at the canvas's own lightness and the slide looks like it has no logo. Every slide here carries one.

Light canvas · the default

Dark mark on a light ground

On an ordinary body slide the mark darkens to a faint gray watermark, top right.

This is the `var()` fallback on `img.deck-logo` — no rule has to fire for it.

- The default
  - `grayscale(1) brightness(0.4) contrast(1.2)` at `opacity: 0.4`.
- Where it comes from
  - Nothing sets `--deck-logo-filter`, so the declaration falls through to its fallback.

Dark canvas · the flip

Light mark on a dark ground

The `dark` modifier declares `color-scheme: dark` and paints the canvas dark, so it sets `--deck-logo-filter` beside that declaration. The mark brightens instead of darkening.

- The flip
  - `grayscale(1) brightness(2.4) contrast(1.1)` at `opacity: 0.45`.
- Declared once
  - Both dark-canvas rules point at `--deck-logo-filter-inverse`, so they cannot drift apart.

Bookends

A divider is dark, so the mark is light

A `divider light` is not

The `light` variant **replaces** the canvas with `var(--bg)`. The mark takes the light-canvas treatment here — and before this fix it did not, because the rule named the layout class `divider` and never asked about the ground. The mark was in the DOM, correctly positioned, and invisible.

Bookends

A closing is dark too

Paper band

Print is a light canvas too

The `print` band is a deck-wide register (`class: print`), not a per-slide class, so it cannot be shown on one slide here. It remaps every consumed token to paper ink, which makes a printed slide a light ground **whatever layout sits under it**.

- The same defect, unreported
  - `title print`, `divider print`, `closing print` and `dark print` all lost their mark for the reason `divider light` did.
- Measured
  - `title print` and `dark print` each gain 1007 differing pixels; the six genuinely dark canvases are unchanged at 0.

What to take away

The canvas decides, not the class

- One predicate, not two
  - Every rule that declares a dark canvas sets the logo token beside it. There is no selector list to add a new layout to.
- Both remaining gaps are closed
  - A `-dark` **theme** flips the canvas without touching a class. The engine reaches it on the theme's own name, above the per-slide rules so a `light` slide still wins.
  - Stacked modifiers (`dark light`, `divider light dark`) now resolve the same way in the PDF and the exported player.
