The catch-all is a layout

The default slide layout

A slide that names no component used to render as raw markdown on a Lattice canvas. It now resolves to `content` — the catch-all prose layout — so writing nothing and writing `_class: content` are the same thing.

No class at all

DEFAULT LAYOUT · #1292

This slide declares nothing

No `_class` directive appears above this heading. It renders as `content` — what a slide with no component resolves to.

KEY INSIGHT

A Key Insight reads as a peer of the body prose — never louder, and never smaller.

✦ *A trailing annotation, promoted to a below-note because it follows a table.*

The same slide, named

DEFAULT LAYOUT · #1292

This one says `_class: content`

Identical markdown to the slide before it, with the directive written out. The two render byte-for-byte the same.

KEY INSIGHT

A Key Insight reads as a peer of the body prose — never louder, and never smaller.

✦ *A trailing annotation, promoted to a below-note because it follows a table.*

Type

DEFAULT LAYOUT · #1292

The distillation is no longer smaller than what it distills

Body prose used to read a tier louder, which left a Key Insight a quarter smaller than the paragraph it summarized.

- A top-level point reads at the body tier
  - A nested point steps down one, so support reads as support
- The measure is a count of characters
  - Not a fraction of the slide, which means something different at every type size

KEY INSIGHT

This panel and the prose above it are the same size. That is the contract.

Flow

DEFAULT LAYOUT · #1292

A trailing block reaches the bottom

The stack used to pack to the top of a full-height stage, stranding a Key Insight or a below-note mid-slide with a fifth of the stage empty beneath it. The stage distributes that slack now — but only when the stack actually ends in a trailing block, so an ordinary prose slide is left alone.

REGION	Q3	Q4
North America	$4.2M	$5.1M
EMEA	$3.8M	$3.9M

✦ *Nothing stretches to achieve it. A table that grew would distribute the extra height into its rows, unevenly — so a table's vertical fill stays the author's call, via* `table-fill`.

Also fixed

The heading you could not see

An `# H1` took its ink from the dark-panel token, which is near-white in all thirteen light palettes. `title` is the only component that puts a heading on a dark panel, and it names that ink itself — so the default served one consumer that did not need it, and made every other author-written heading invisible.
