Feature demo · slide chrome

A slide's header stays on that slide.

Front matter sets the header and footer for every slide. A slide comment sets its own slide only.

Front matter sets every slide

- This slide shows the deck's header, footer and page number.
- The header and footer come from two lines at the top of the deck: `header:` and `footer:`.
- Page numbers are on by default; `paginate: false` there would turn them off.

A plain header comment

- This slide carries `<!-- header: "Appendix A · this slide only" -->`.
- Its header reads "Appendix A · this slide only". Marp would carry it onto every later slide; Lattice does not.

The next slide is back to the deck's header

- No comment here, so the header is the front matter's again.
- Nothing carried over from the slide before.

An underscore footer, as before

- `<!-- _footer: … -->` still sets this slide only.
- The plain spelling now means the same thing.

Dropping the deck's chrome on one slide

- `_class: no-header no-pagination` hides the header and page number here.
- The footer stays, because only those two are named.

And the deck's chrome is back

- Every later slide reads the front matter's header, footer and page number.

Front matter for every slide; a comment for one.
