heatmap · the row-name gutter fits the names

Row names read on one line.

The row names used to sit in a fixed gutter that held about ten characters. An ordinary month cohort like **September 2026** wrapped onto two lines while **May 2026** sat on one, so the label column read ragged. The gutter now fits the widest name.

Retention · 2026 cohorts

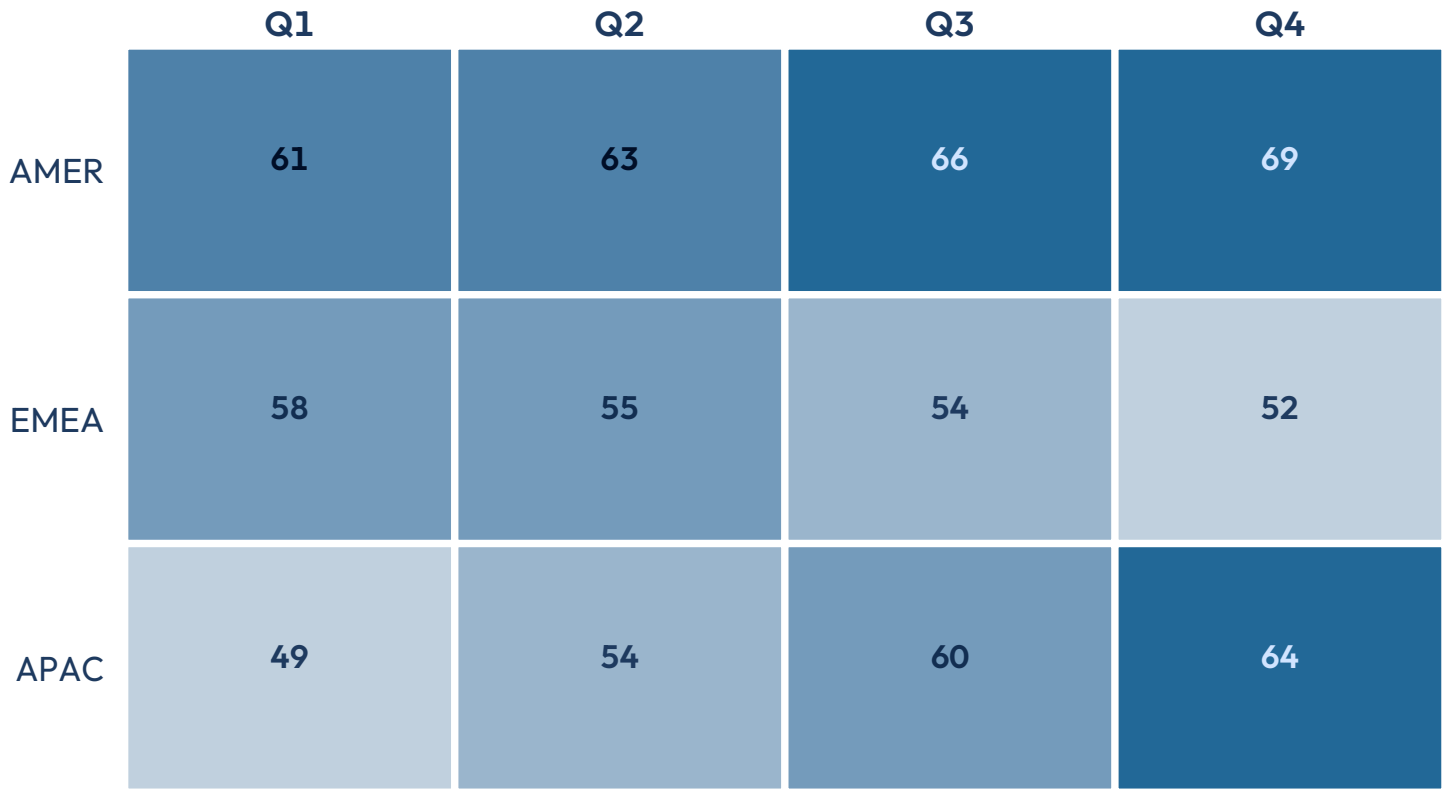

Retention decays fastest in month two.

Full month names · every one on a single line

Gross margin · by region

Margin recovered everywhere except EMEA.

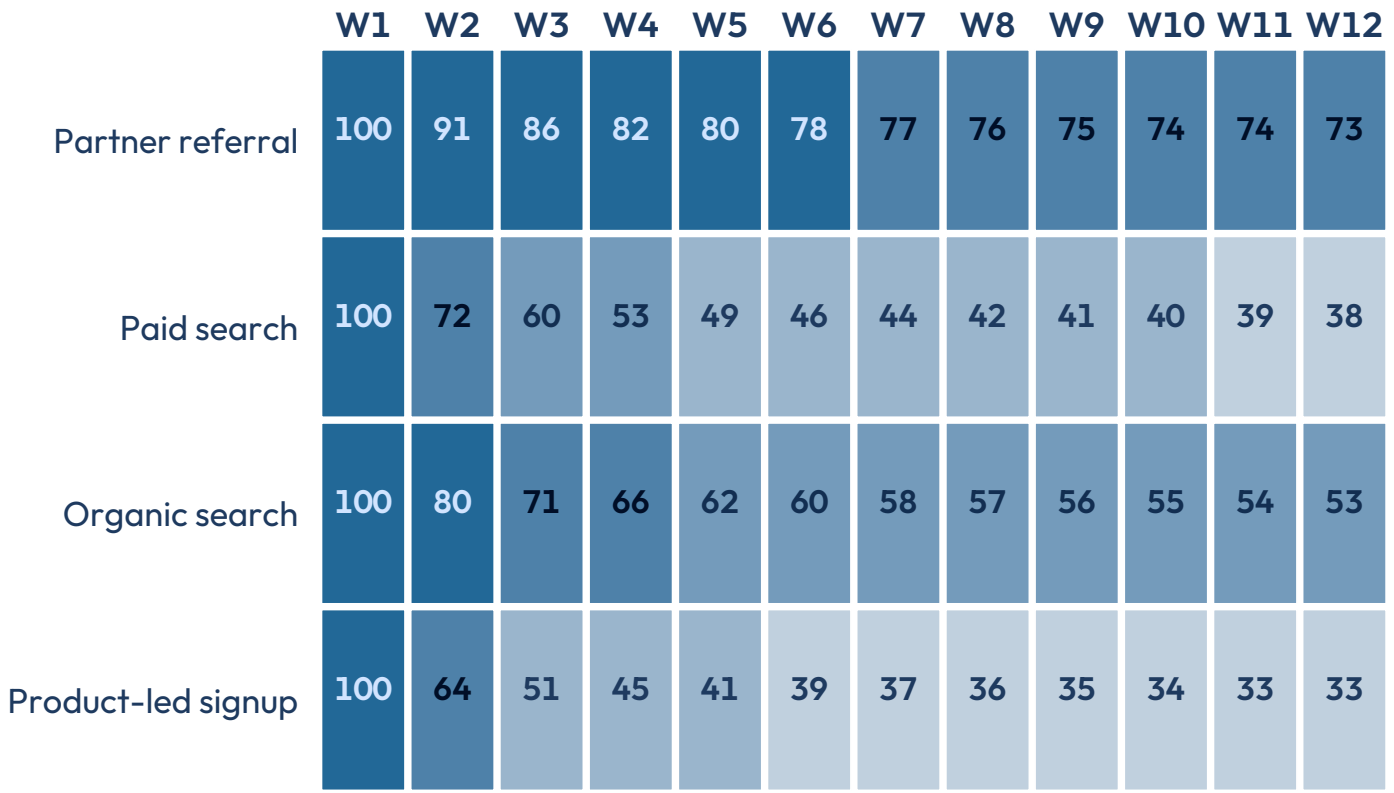

The cells keep their numbers first.

A wider gutter narrows every cell, and a cell too narrow for its number drops the number entirely. So the gutter grows only while every value and column name that printed before still prints. Past that point a long row name wraps to a second line, which a reader still reads in full. A dropped value cannot be read at all.

Weekly active · by acquisition channel

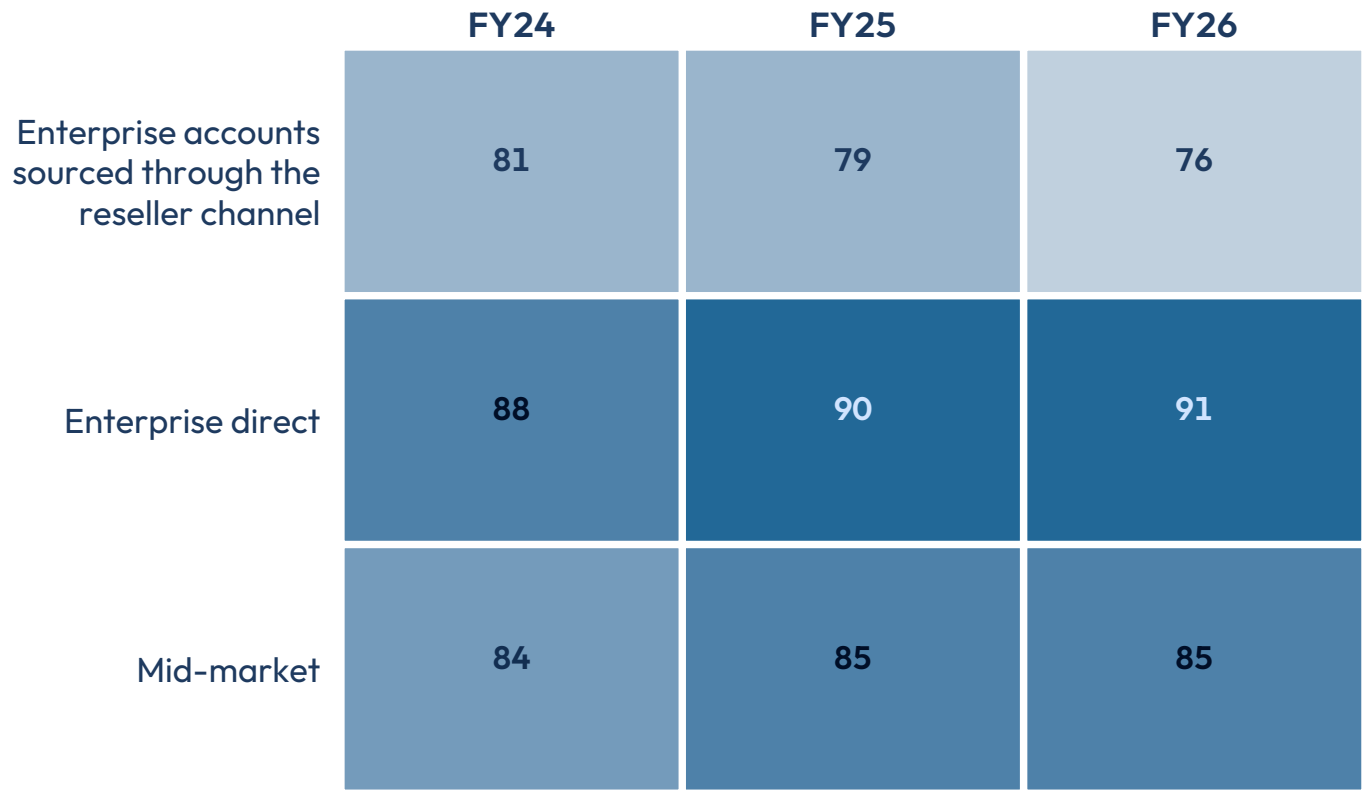

Partner referrals hold their users longest.

Twelve columns · the numbers hold, long names wrap

Renewal rate · by segment

Channel accounts renew below direct ones.

The ceiling is the bar chart's.

The gutter stops at 96 of the chart's 320 units, the same ceiling `bar` gives its row names. A row name longer than that is a sentence, and the fix is to shorten it. The grid should not give up a third of its width to one label.
