Present · Read · Share

The deck that is also a webpage.

One self-contained `.html` — double-click it and it *is* your deck. No install, no network, nothing to configure.

A deck is a talk and a document at once.

So the exported file is both. It opens in **Present** mode for the room, reflows to a scrolling **Read** view for the reader, and never phones home — every font, image, and diagram is baked into the single file you send.

Three views

The same deck, three ways.

Present

One slide at a time, fit-scaled to any screen, arrow-key navigation.

Read · Slides

Every slide stacked in a scrolling column — full fidelity, nothing lost.

Read · Article

A Typora-style document with a table of contents down the left.

Built to be shared

Portable by construction.

Self-contained

Fonts, images, and charts inline as data — zero external requests.

Locked down

The slide HTML is sanitized and pinned behind a strict content-security policy.

Round-trips

The exact source rides along, so the file re-opens into Lattice losslessly.

"Give me the one file that is my deck."

THE EMOTIONAL DEFAULT A SHARE FORMAT HAS TO EARN — NOT A ZIP TO UNPACK, NOT A LINK THAT ROTS. ONE FILE, AND IT JUST OPENS.

It adapts to the reader.

Both color modes are baked in, so the file follows the reader's system preference and flips on a single tap — the whole document re-themes at once, slides and article alike.

lattice deck.md deck.pdf --player

Write once. Present, read, and share from the same file.
