Callout plugin

Labels a chart did not have

One model for every key, value label and callout. First capability: a heatmap callout, written in one line.

Retention · 2026 cohorts

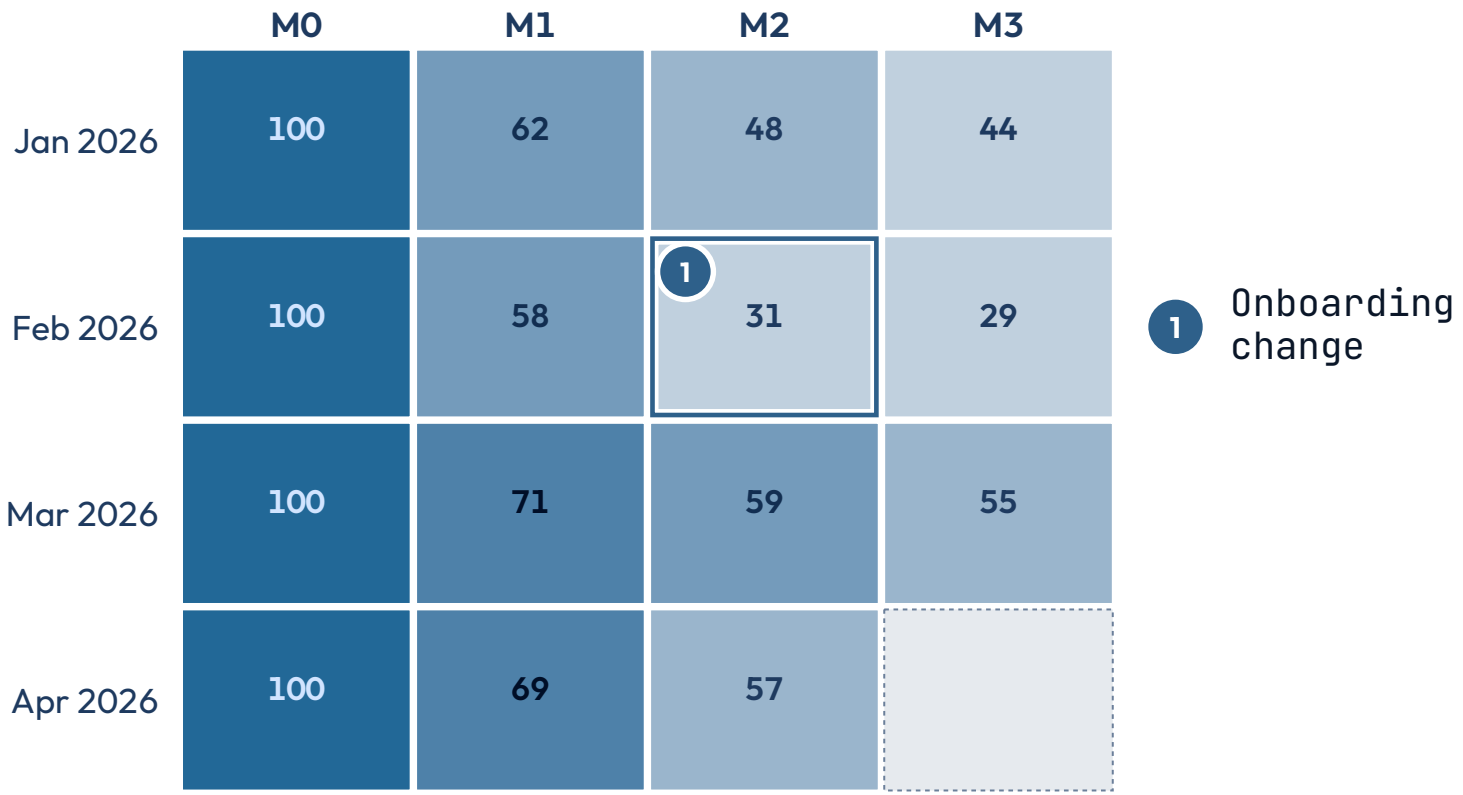

Before: the grid carries the data, and nothing points at the story.

Before · a heatmap with no callout. The reader has to find the drop-off alone.

Retention · 2026 cohorts

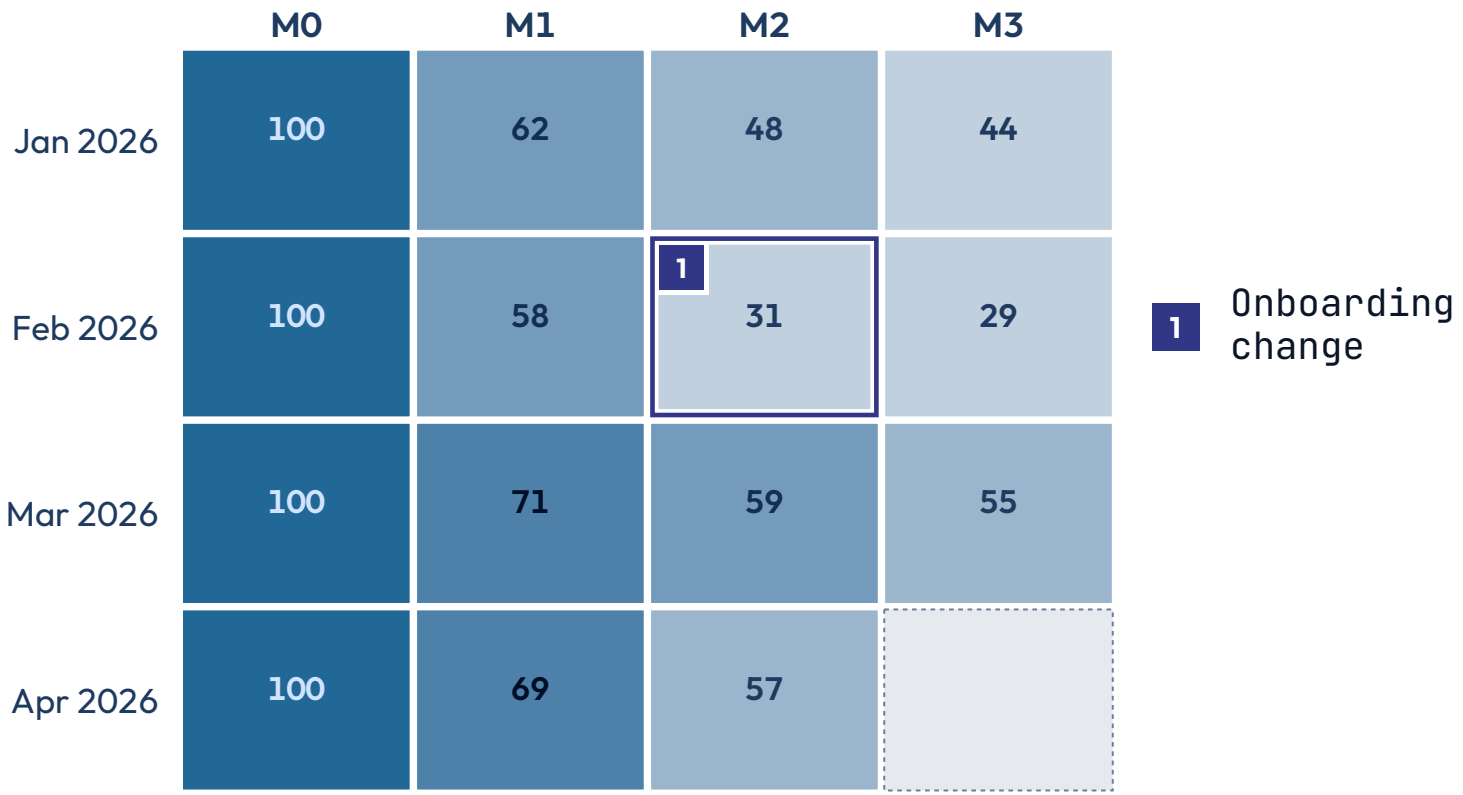

A numbered callout names the cell that matters.

The default: the first callout is a circle with its number, on the cell and again before the words.

Retention · 2026 cohorts

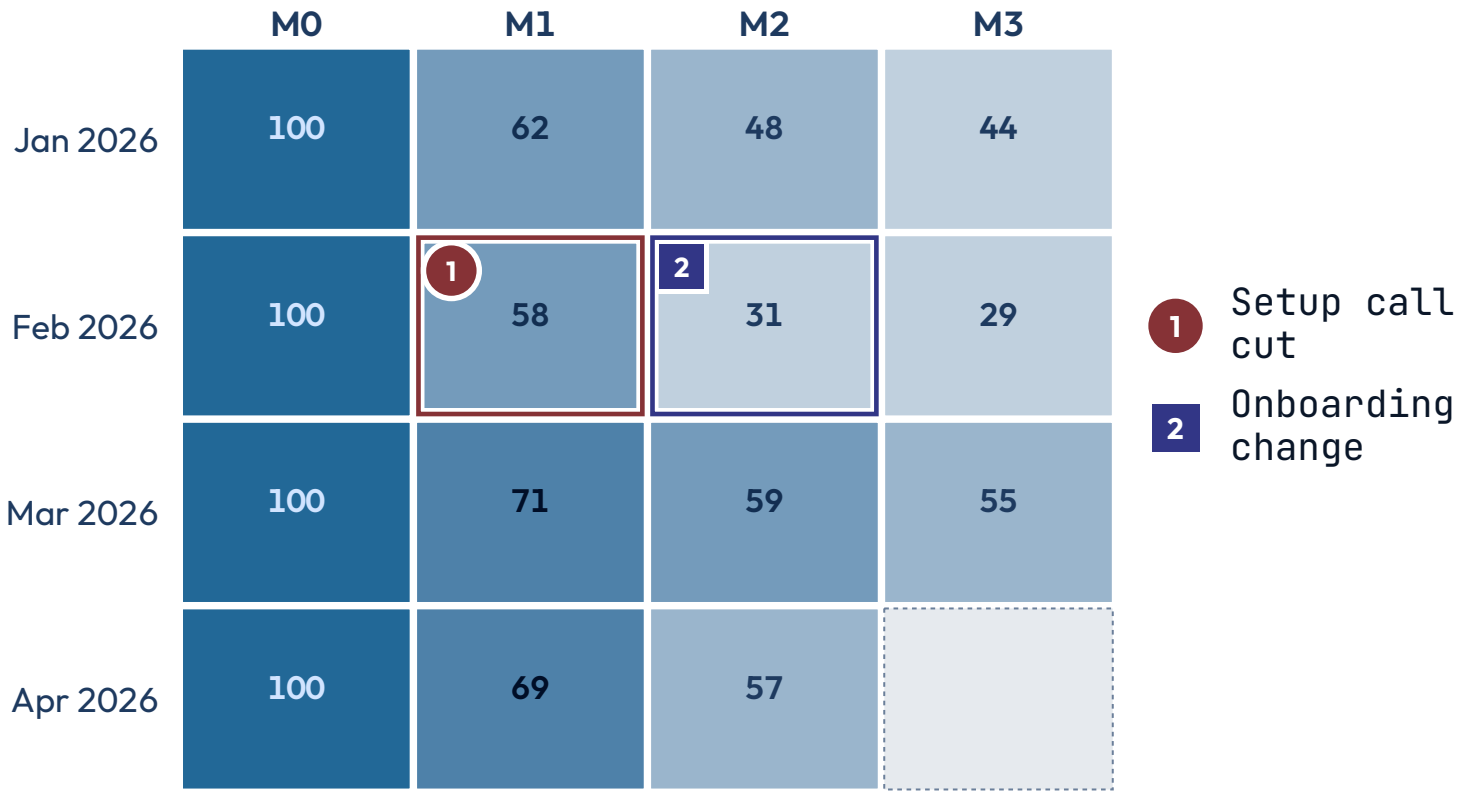

The pill's words pick the marker's shape and color.

The pill's words pick the marker: {…, tag, c4} is the square in color slot 4.

Retention · 2026 cohorts

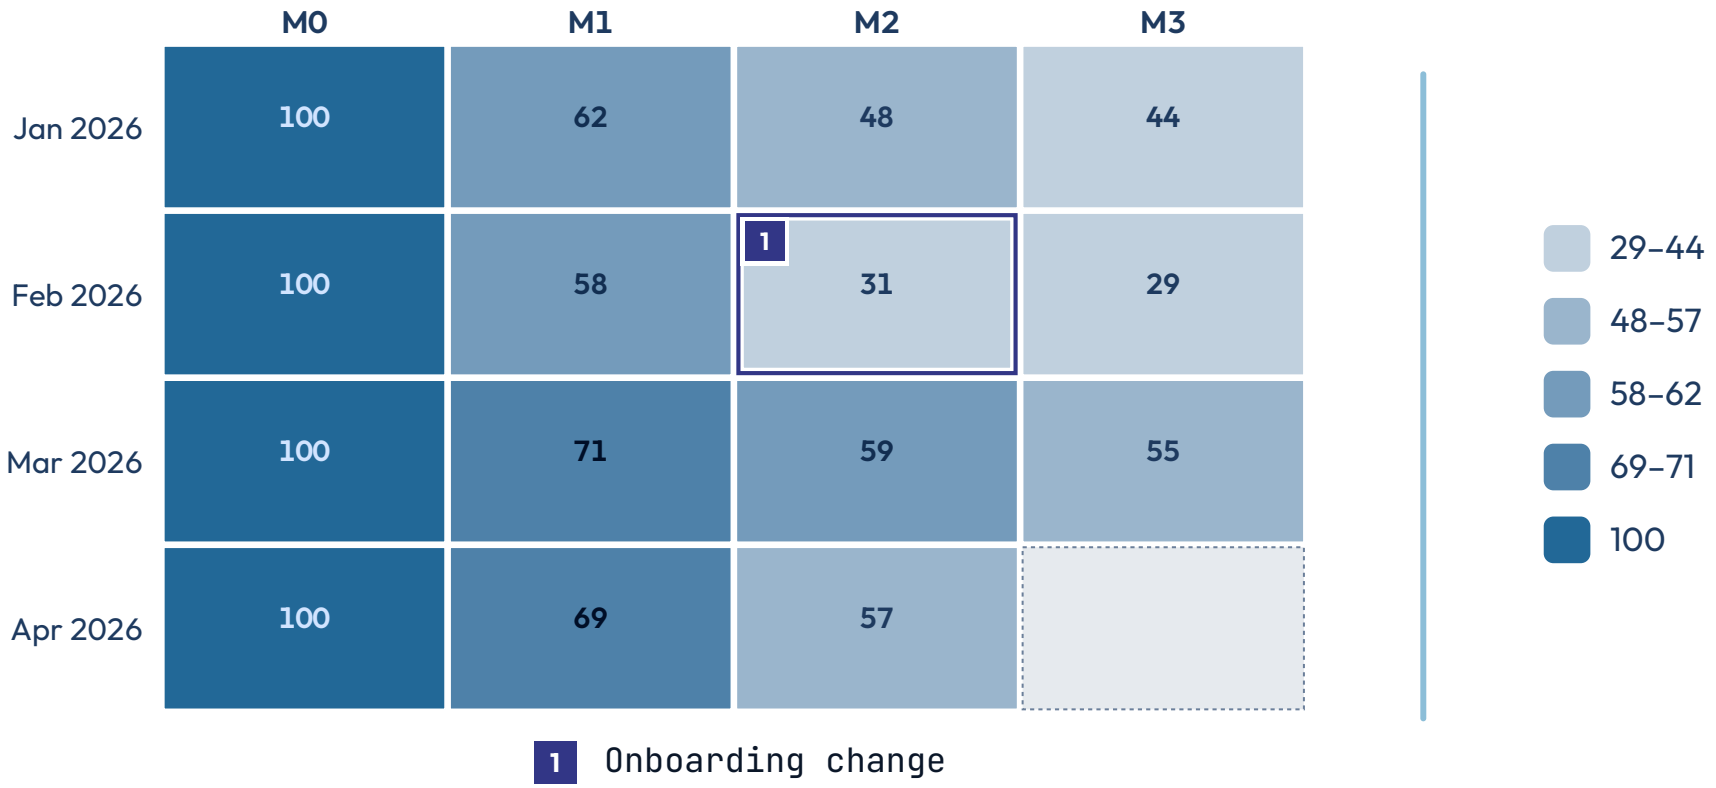

Two callouts on one row, and neither is ambiguous.

A list of records. Two on one row stay apart: each has its own shape and color, and nothing crosses the grid.

Retention · 2026 cohorts

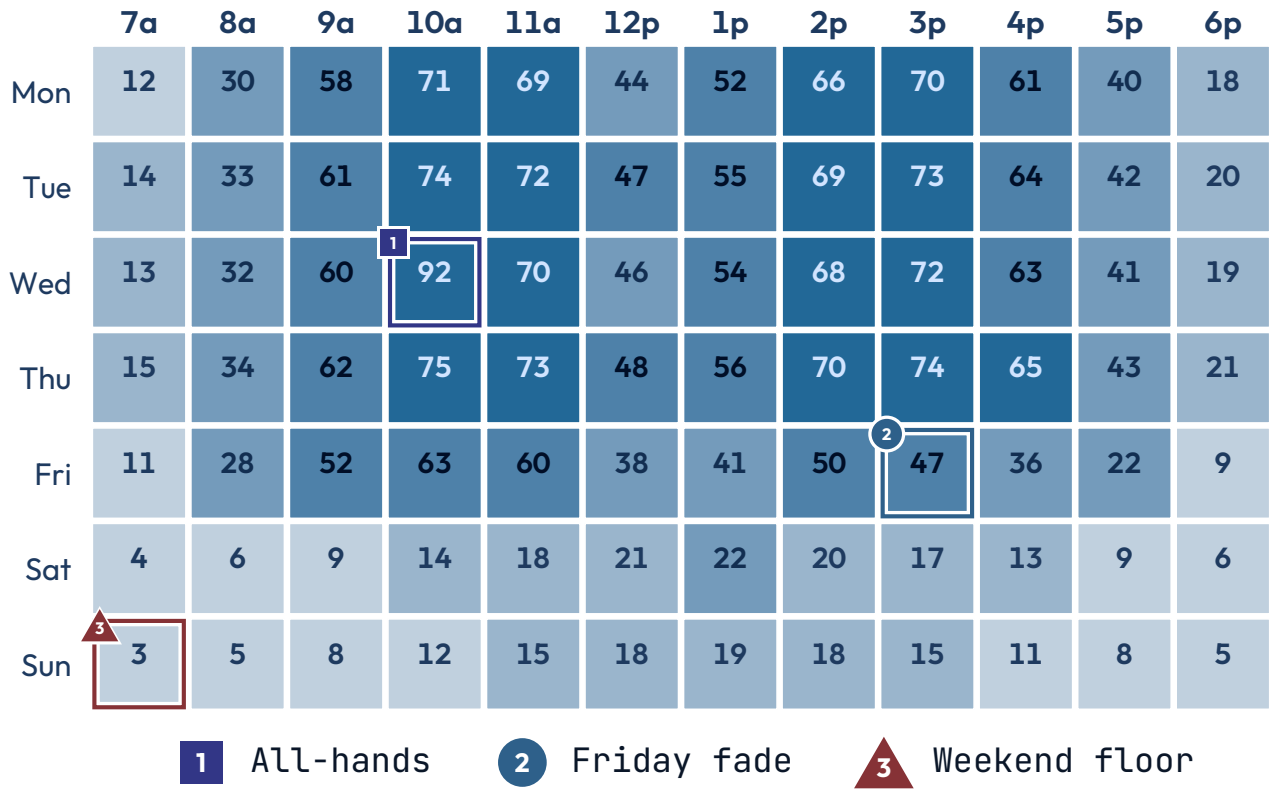

The callout and the band key share one figure.

With the band key. The key and the callout each sit on the side that leaves the grid largest.

Usage · hour by weekday

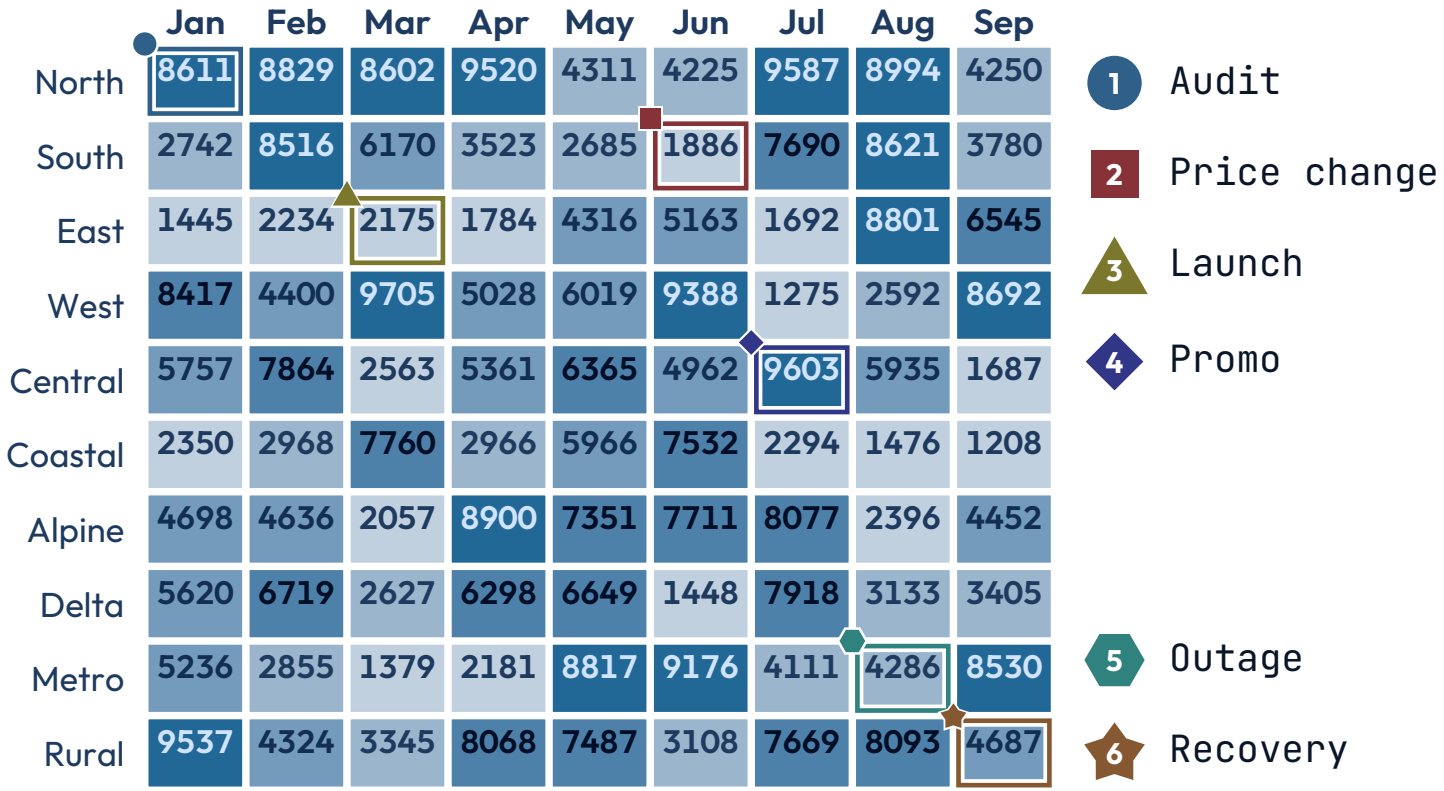

At the density ceiling, callouts still find room.

Stress · seven by twelve. No room inside a cell, so every marker takes the same badge spot.

Revenue · region by month, $K

On a crowded grid, the shape alone marks each cell.

Stress · ten rows of four-digit values: no room for a digit, so each cell carries its shape alone.

One line of Markdown, every surface: the slide, the hover card, the speaker note, narration.

A heatmap callout is the callout plugin's first capability. The other charts take callouts one family at a time.
