logo-wall · equal-weight sizing

No mark wins the room by being wide.

Beside a crest, wordmarks come down to a badge's area, and the crest keeps its own size: 2× apart, not 3.6×. No row stands taller.

A box that fits every mark favors the wide ones.

The wall used to draw each mark as large as its cell allowed. A cell is wide and short, so the shape of the mark decided its size.

- A 4:1 wordmark filled the cell's width and got **2.7×** the area of a 1:2 crest; a 3:1 wordmark got **3.6×**.
- Now the marks share **one area**, and no mark stands taller than the old row. A crest stops at the row with half the area: **2×**, not 3.6×.
- The packer is `@laticent/mosaico`'s `rows` strategy, the same library the collage packs with.

Four shapes

Wordmarks and a badge share one area; the crest stops at the row.

Dense

The long roster keeps the same rule.

Color

Balanced rows: ten marks break four, three, three.

Wordmarks only

A wall of one shape looks exactly as it did.

One area, capped at the row.

The area is measured on each mark's own box; how much ink a mark puts inside that box is the designer's, not the wall's.
