DIAGRAM TYPE · ENGINE

The hand reaches the diagram

A sketch deck used to wrap hand-drawn shapes around machine-faced labels. Now the whole slide speaks in one voice — including the diagrams.

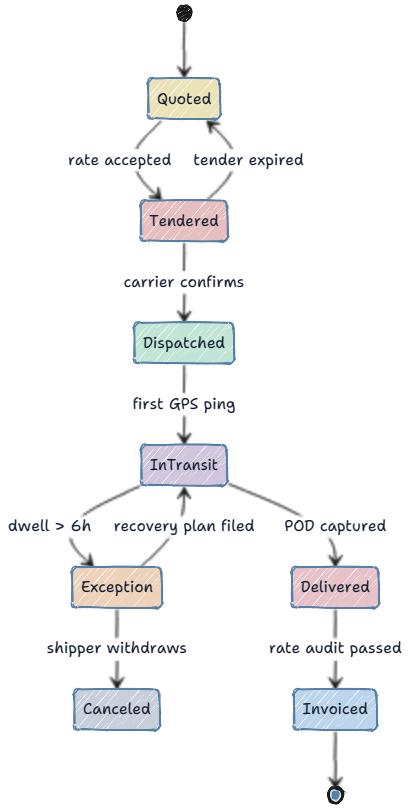

FLOWCHART · CONSIGNMENT INTAKE

Where a booking can stop, and who is holding it.

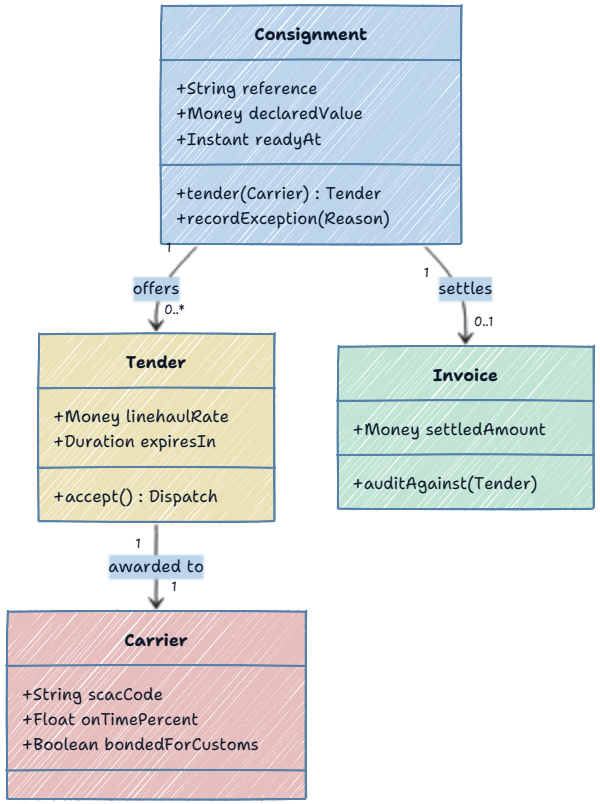

STATE DIAGRAM · CONSIGNMENT LIFECYCLE

Every status a shipper can see, and the transitions we allow.

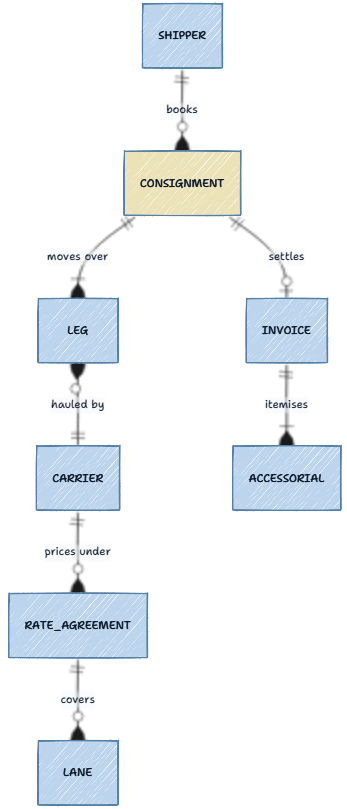

CLASS DIAGRAM · DOMAIN MODEL

The four aggregates the booking service owns.

ENTITY RELATIONSHIP · SETTLEMENT SCHEMA

What rate audit actually joins across.

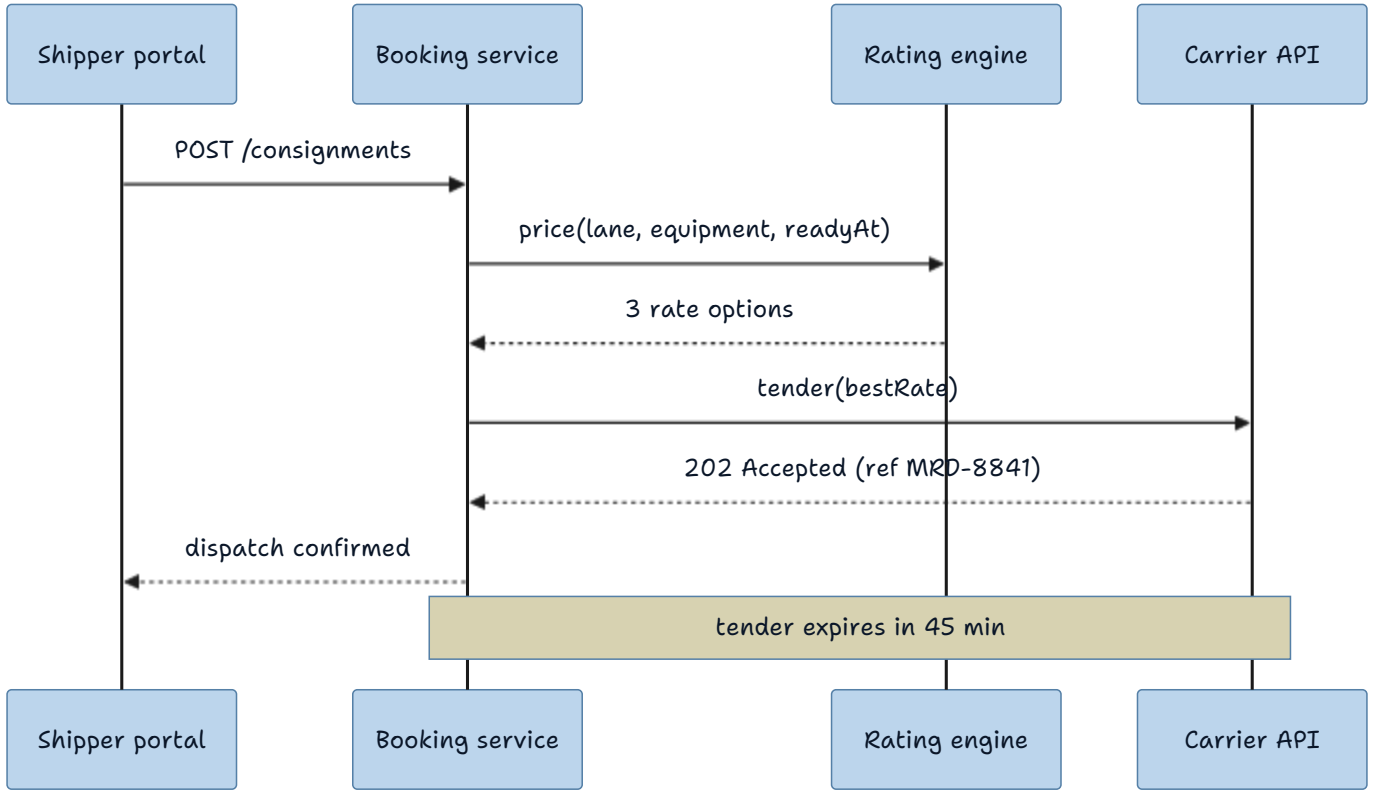

WHY IT WAS NEVER A CSS FIX

Mermaid measures a label in the browser that renders it.

- The measurement happened somewhere else
  - The export shelled out to a binary whose page carries none of the deck's fonts, so every label was sized in a fallback face.
- Then the paint moved
  - The finished SVG lands in the deck, where the real face loads — and the box no longer fits the text it was measured for.
- Why mono never showed it
  - Its stack ends in the `monospace` generic, whose fallback metrics nearly match. No hand face has that luck.

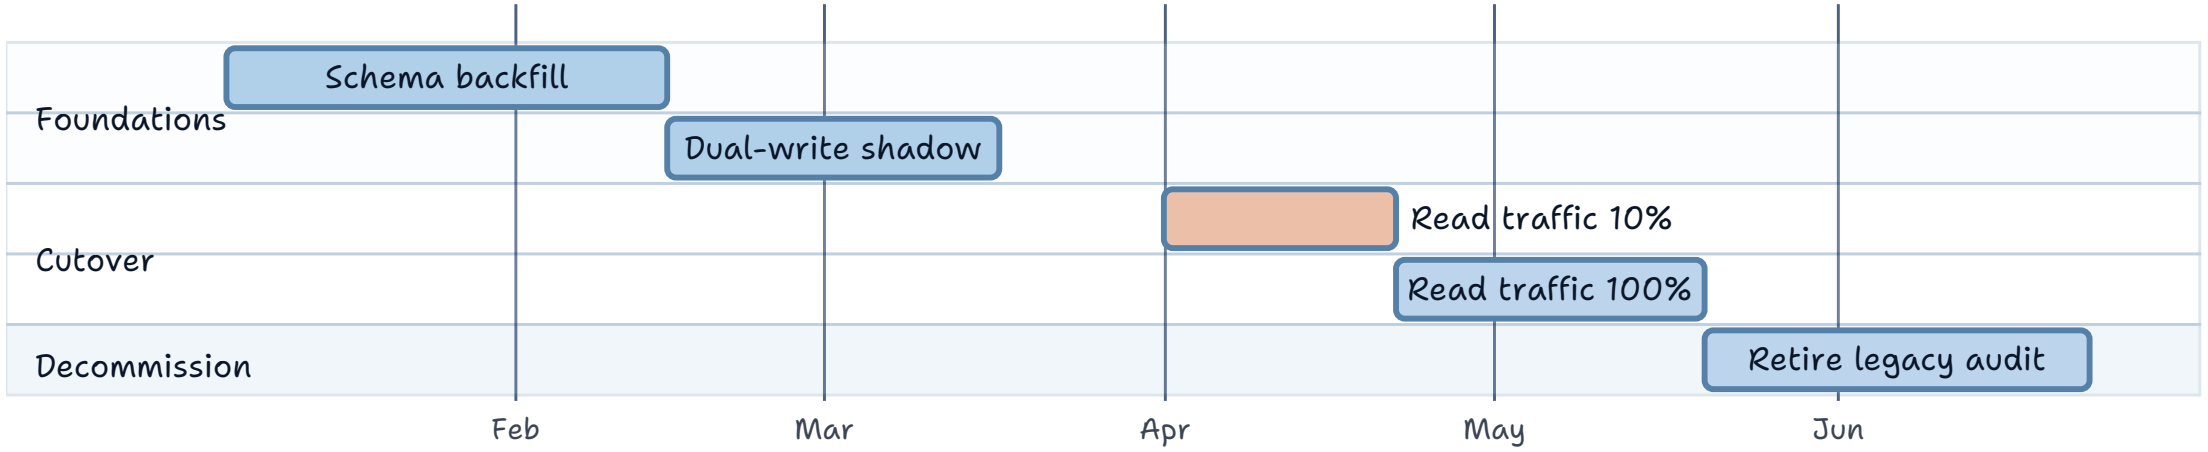

SEQUENCE · LEGACY RENDERER

Machine-drawn shapes, hand type — the tender API round trip.

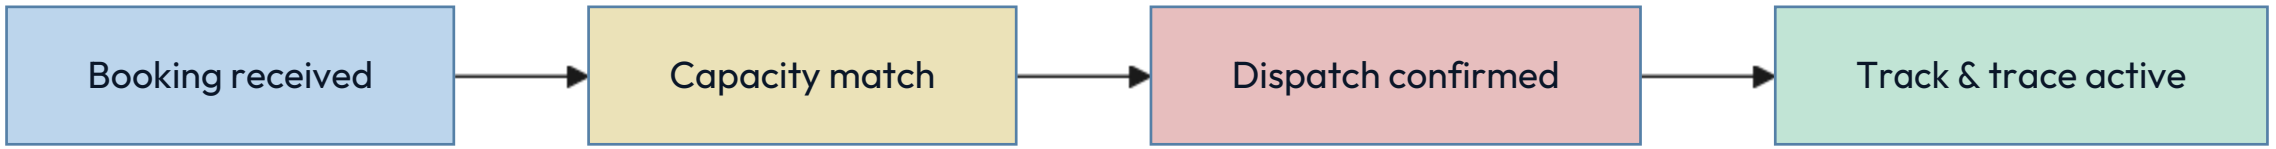

GANTT · LEGACY RENDERER

The migration plan, in the deck's own voice.

Per-slide opt-out

One slide can step out of the finish entirely.

WHERE THE SHAPE ANSWER STOPS

Texture outranks the finish, and always did.

- Pattern is data, not decoration
  - On `a11y-*`, `onyx` and `concrete` the per-category texture is how a color-blind or monochrome reader tells nodes apart.
- A hachure cannot carry a tile
  - Painted through a 4px variable-width stroke, four distinct patterns collapse to four grays 5% apart.
- So those decks split the difference
  - Machine-drawn shapes, hand type. Style never overwrites an accessibility affordance.
