A drawing, and the order it arrives in

Describe a drawing or bring one, and Lattice finds its parts. You give each one a beat, and it plays — on screen. On paper the finished drawing holds. **Every drawing and every plan below came out of the faculty** — the art, its ids and the fence beneath it are what Insert wrote. The frame around them is this deck's: the title, the divider, the closing, and each scene slide's gallery class and footer.

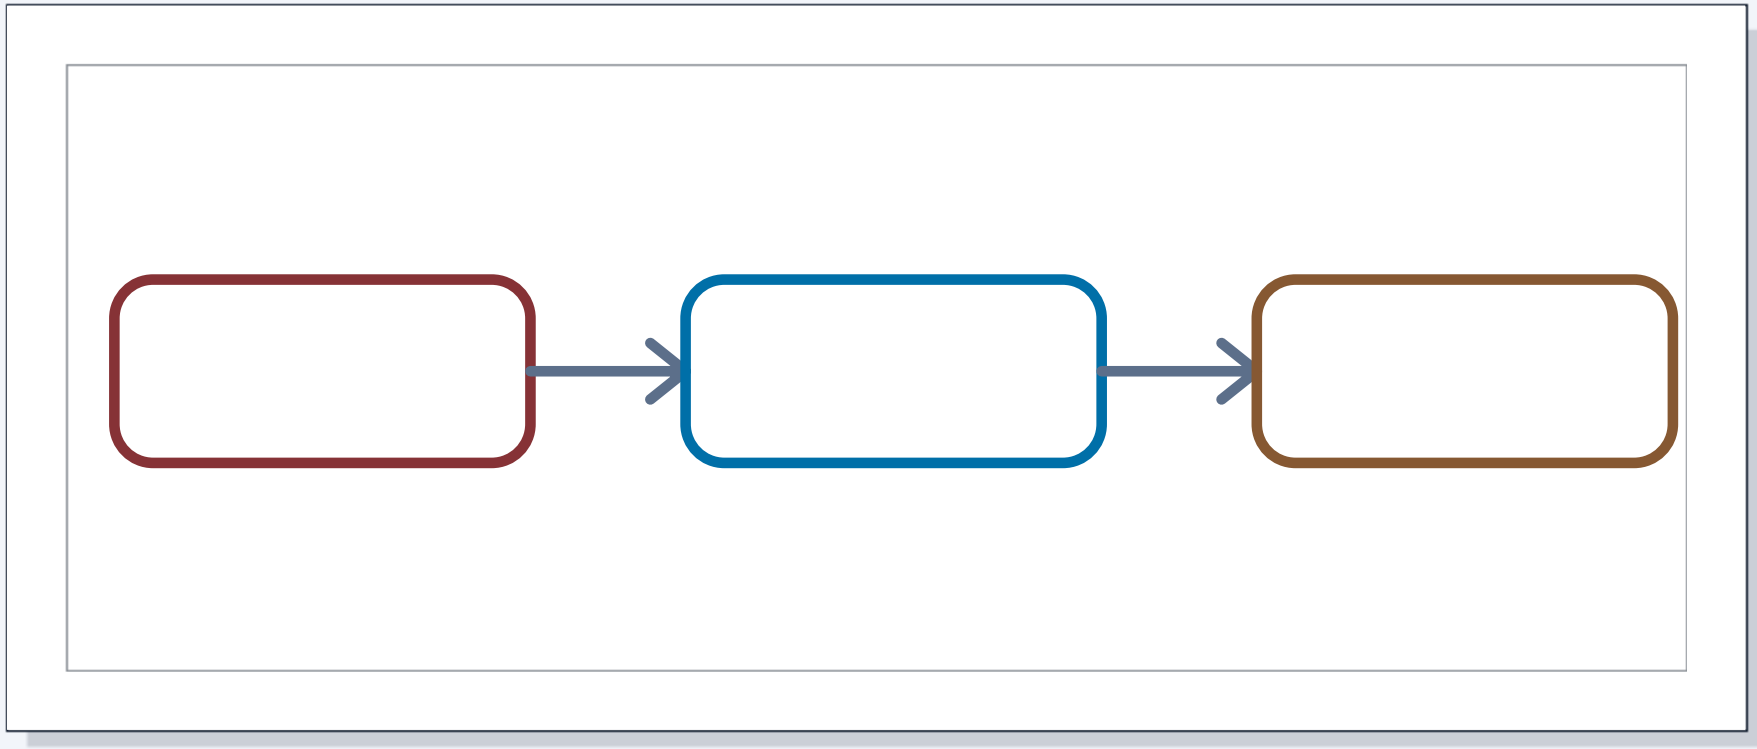

The premise

Order is the argument a still cannot make.

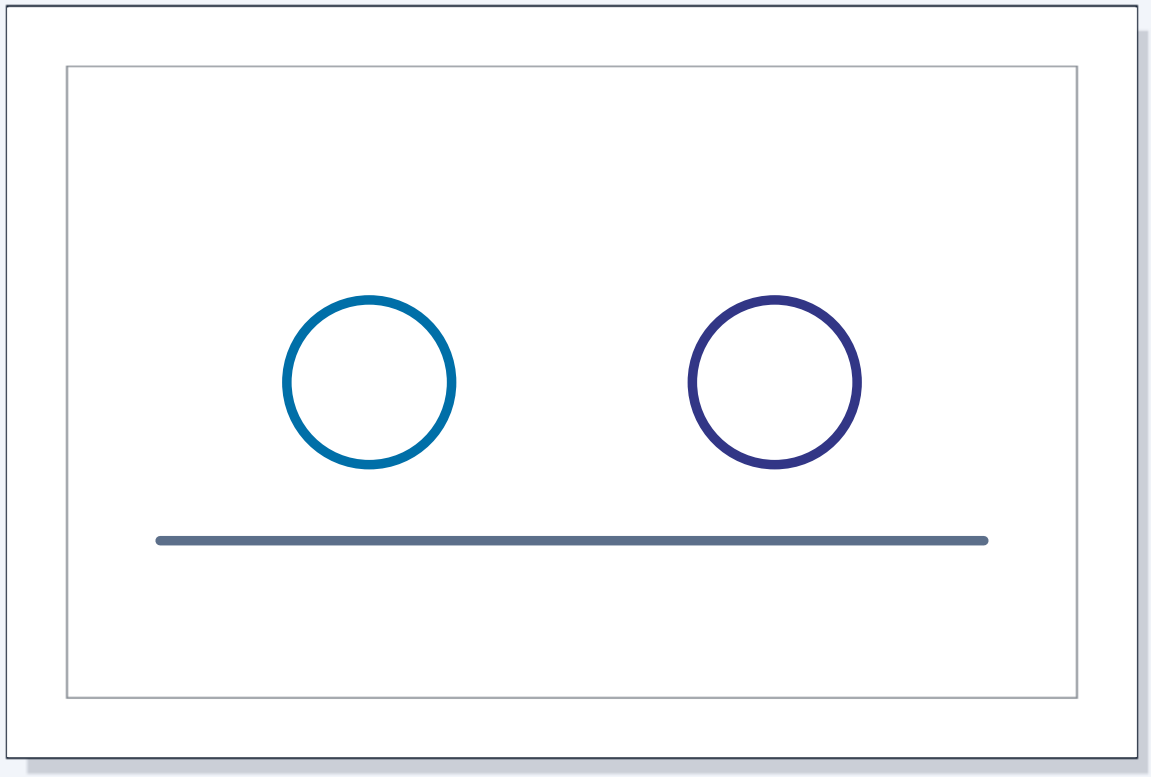

Together, the pipeline is just a picture.

Three stages and two arrows, all on one beat. Everything arrives at once — which is what a static diagram already does, so the motion adds nothing here, and the faculty says so.

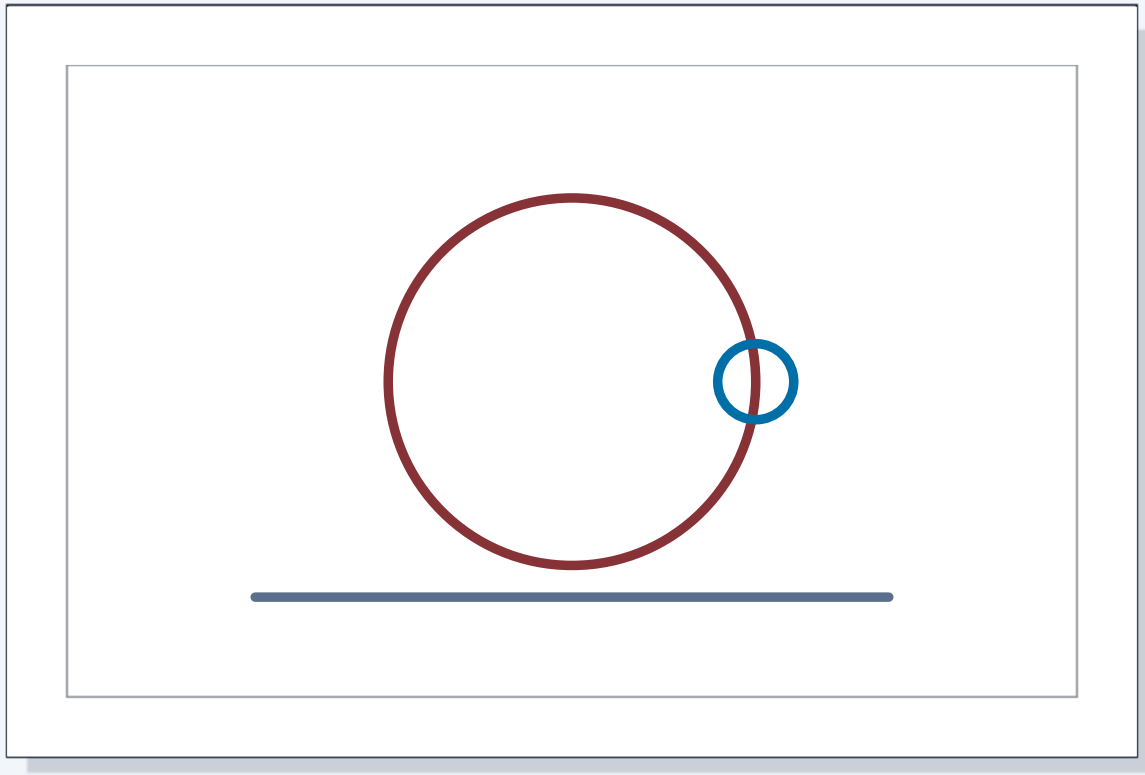

Beat by beat, it becomes a sequence.

The same five parts, one per beat, each drawing itself. Now the drawing says *first this, then that* — a claim about order the still can only imply. The parts did not change; the running order did.

A part can arrive from somewhere.

Slide pairs with a fade, always. A shape that travels home while fully opaque reads as one that was always there and merely moved — not as an arrival, which is what a beat means.

The still is the finished drawing, never a half-drawn one.

Every plan the faculty writes sets a hero of 1, so the frame the PDF freezes is the last one. A half-drawn diagram is a defect, not a fallback — and a reader who asked for reduced motion sees exactly this page.

Fabricate · Motion

Craft it once. Place it anywhere.

A saved motion is a drawing plus its running order, in one record, on your Library shelf. Insert writes the slide; the drawing travels inside the deck, so a deck you forward carries its own art.
