Label sets · obligation-matrix · a key the grid draws for itself

The key you used to retype.

This layout's key was a sentence the author wrote by hand on every slide — bound to nothing, and easy to forget. Its own docs listed forgetting it as an authoring mistake. The grid now draws the key from the markers in its cells.

The grid names its own markers.

REGULATION	NOTICE	CONSENT	RETENTION	BREACH
GDPR	✓	✓	✓	✓
CCPA/CPRA	✓	−	✓	✓
PIPEDA	✓	✓	−	✓

✓ Applies − Partial

Nothing is authored here. The key under the grid is built from the cells.

A key never names a marker the grid does not carry.

REGULATION	NOTICE	CONSENT	RETENTION
GDPR	✓	✓	✓
LGPD	✓	✓	✓

✓ Applies

Every cell here applies, so the key has exactly one row. A row pointing at no cell is one the reader cannot find.

The same grid, for a licensing review.

REGIME	REGISTER	DISCLOSE	AUDIT	RENEW
Class A	✓	✓	✓	✓
Class B	✓	−	✓	/
Class C	✓	/	/	/

✓ In force − Partial / Not subject

Two markers renamed; the third keeps its default.

The key cannot drift from the cells.

REGULATION	NOTICE	CONSENT	RETENTION	BREACH

CCPA/CPRA	✓	−	✓	/

✓ Exposed − Partial / Carved out

Heat marks burden, not relief — exempt cells stay neutral. The key's swatches take the cells' own classes, so one stylesheet rule paints both.

What changed.

- The key is drawn from the cells, not typed by the author
- Only the markers actually present get a row, in a canonical order
- The words are a default: rename any marker, the rest keep theirs
- A marker is addressed as `[x]`, exactly as a cell spells it
- One stylesheet rule paints both the key and the grid it decodes
