function-plot on the plugin host · a math fence · a tokenized KaTeX error

Plugins, phase B

function-plot · one hydrate source

The curve comes from the same function on every surface.

$$\sigma(x) = \frac{1}{1 + e^{-x}}$$

The logistic link: S-shaped, $\sigma(0) = 0.5$.

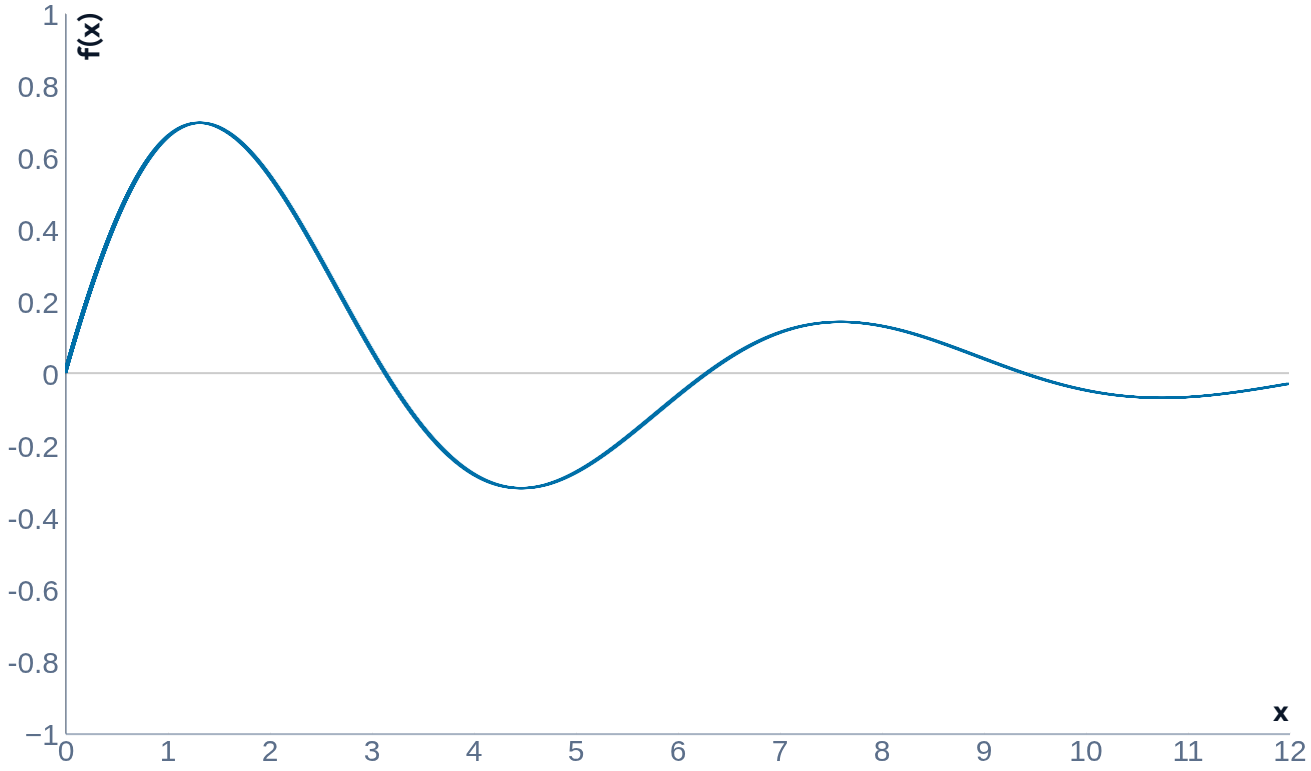

Unchanged pixels, one source: the runtime and the CLI page run the same hydrate.

function-plot · the deprecated alias

An old latticeplot fence still draws, and says it is old.

$$f(x) = \sin x \cdot e^{-x/4}$$

A damped oscillation, written with the old fence name.

The render reports function-plot/deprecated-alias.

function-plot · a config that fails

A broken config says why, on the slide.

$$g(x) = \sqrt{x}$$

```
functionplot error: Expected ',' or '}' after property value in JSON at
position 32 (line 2 column 1)
```

The config below is missing its closing brace.

math · the fence form

A math fence typesets like a display block.

$$\hat{\beta} = (X^\top X)^{-1} X^\top y$$

WHERE

- $\hat{\beta}$ — the least-squares coefficients
- X — the design matrix, one row per observation
- y — the observed responses

math · a formula KaTeX cannot parse

A broken formula quotes itself in the theme's error ink.

`\frac{a}{b`

WHERE

- An unclosed group: `\left( x + y` renders as its source
- An unknown command: \dfracc$ab$ shows the literal command
- A correct one beside them: $\frac{a}{b}$

KaTeX errorColor is var(--warn) now, not an inline #cc0000.
