roadmap · horizons · portrait · 2026-06-19

A roadmap that reads down the page.

A roadmap is a wide grid — workstreams down, phases across. On a tall deck those columns crush. So portrait picks the form the engine already had: the phase cards, stacked into one column you read top to bottom.

Same table, the right shape for the box.

You author the same workstream × phase table. The kernel reads the deck's orientation and, on a tall box, transposes it to phase cards and stacks them — no second authoring.

Phases become cards →

Same table, the right shape for the box.

Phases become cards, each carrying its workstream rows.

Cards stack →

Same table, the right shape for the box. (cont.)

Cards stack down the page; the header collapses to one line and each row reads `LABEL · value` so three or four phases fit.

Landscape is untouched →

Same table, the right shape for the box. (cont.)

Landscape is untouched — the wide table renders exactly as before.

H1 2026 – H2 2026
