Statement · premise

Rows that grow

`premise` cut any term past about eleven characters — `Communication` rendered as `Communic…`. The term column now sizes itself to the longest term, the split gives the ledger room, and the gap between rows follows how many there are.

Senior engineers multiply, not add.

Five skills separate an engineer who ships from one who lifts the team around them.

01	Communication	Say the hard thing clearly and early.	Who needs to know?
02	Prioritization	Choose the work that compounds.	What matters most now?
03	Mentorship	Grow the people beside you.	Who can do this next?
04	Architecture	Shape systems that outlast you.	What will this cost later?
05	Accountability	Own outcomes, not tasks.	Did it actually land?

Three habits carry the rest.

A short ledger gets the room a long one cannot have.

01	**Communication**	Say the hard thing clearly and early.	Who needs to know?
02	**Judgment**	Choose the work that compounds.	What matters most now?
03	**Leverage**	Grow the people beside you.	Who can do this next?

Leadership is a set of named jobs.

Terms grow past one word; each description stays one clause.

01	Communication	Say the hard thing clearly and early.	Who needs to know?
02	Stakeholder management	Keep the people who fund the work aligned.	Who is surprised?
03	Technical leadership	Set direction the team can execute on.	Where are we headed?
04	Accountability	Own outcomes, not tasks.	Did it actually land?

Eight is where one palette cycle ends.

Past eight rows the categorical hues repeat.

01	Novice	Follows a script closely.	Can you repeat it?
02	Advanced beginner	Recognizes recurring situations. Have you seen this before?	
03	Competent	Plans deliberately.	What is the goal?
04	Proficient	Sees the whole situation.	What matters here?
05	Expert	Acts from intuition.	What feels wrong?
06	Master	Extends the practice.	What is missing?
07	Communicator	Shares the craft.	Who can learn this?
08	Steward	Protects the field.	What must last?

What changed

PREMISE · TERM COLUMN, SPLIT AND ROW RHYTHM

Three moves, one component

- One term column
  - The ledger is a single grid and each row is a subgrid of it, so the term column is sized once, to the longest term, instead of a fixed 140px per row.
- A flexible split
  - The claim rail takes spare width first up to 34%, and gives it back to the ledger down to a 26% floor when the rows need it.
- Rhythm by count
  - Three rows get a loose gap, four or five a medium one, six or seven a snug one, and eight the tight rhythm the layout always had.

Longer words, same ledger.

Only a term wider than 40% of the ledger, or a clause wider than its whole column, still ends in an ellipsis.
