This very PDF carries the hint. Open it in Adobe Acrobat or Reader and it launches full-screen — no menu hunting.

Export · Full-screen on open

Open straight into presentation mode.

A few catalog hints turn a PDF into a deck.

The document opens in full-screen	`/PageMode /FullScreen` plus a single-page layout — one slide filling the display, the same hint Keynote and PowerPoint emit.
Leaving full-screen lands somewhere clean	A page-only fallback (no thumbnail or bookmark panel springing open) and fit-to-window, so the exit is as composed as the entrance.
Slides cross-fade as you advance	A subtle `/Trans /Fade` between pages — presenter-driven, with no auto-advance timer.

Honored where it helps, ignored where it doesn't.

Adobe Acrobat and Reader	Open the deck directly in full-screen presentation view — the headline case this is built for.
Most desktop PDF viewers	Respect the same full-screen and single-page hints; presenting from a laptop just works.
Browsers and macOS Preview	Quietly ignore the hints and open the deck normally — a no-cost enhancement with no downside anywhere.

One flag, or one line of front matter.

Turn it on at export `lattice deck.md out.pdf --present` marks the exported PDF; every other byte is unchanged.

Or bake it into the deck A `present: true` front-matter key does the same for that deck, mirroring how `--fluid` works.

Off by default Without the flag or key the catalog is untouched, so no deck opens full-screen by surprise.
