*Print · paper · N-up · notes*

# Three ways to leave the room with paper.

The Print drawer and the `lattice` CLI now fit a deck onto real sheets, pack several slides per page, and print a speaker-notes handout — the boardroom leave-behinds.

*Paper size*

# Fit the deck onto the paper you actually have.

---

- Auto picks the least-wasteful sheet for the aspect — 16:9 lands on US Legal, 4:3 on Letter.
- Every slide is fit and centered inside a 9mm safe margin, never cropped.
- The CLI bakes the paper MediaBox: `lattice deck.md deck.pdf --paper letter`.

# One kernel decides the sheet, everywhere.

**Studio drawer**

Flip paper or orientation and the preview re-fits instantly, no re-render.

**Node CLI**

The same `--paper` decision, baked into the exported PDF's MediaBox.

**Shared math**

`resolvePrintSheet` lives in one place, so the two surfaces can't disagree.

*What N-up saves*

# More slides, fewer sheets.

| | | | |
|---|---|---|---|
| **1** SLIDE PER PAGE, THE DEFAULT | **2** STACKED PER SHEET, REVIEW-FRIENDLY | **4** TO A PAGE, THE 2×2 GRID | **9mm** SAFE MARGIN, ALWAYS HELD |

# Pick the layout for the room.

**One-up**

Full-page slides — the projector-quality print.

**Two-up**

Two slides a sheet — halves the paper for a read-through.

**Four-up**

A 2×2 grid — the compact hand-around.

**Notes**

Each slide over its speaker notes — the presenter's leave-behind.

*Notes handout*

# The slide and what you meant to say about it.

- Each page carries one slide on top and its speaker notes below.
- Notes come from the same boundary the presenter reads — they can't drift.
- Portrait gives the notes the most room; long notes clip with an ellipsis.

*Print · shared kernel*

# Configure the sheet. Print the room.

*Paper, N-up, or notes — one rasterize, assembled the way the moment needs it.*
