B&W-safe · ink on paper

The boardroom deck that survives the printer.

Print mode renders the whole deck ink-on-white — grayscale plus textures, so nothing depends on hue. Set `color-mode: print`, or export with `--print`.

Why a print band

Hue is the one channel a gray printer throws away.

- Five tints that differ only in color collapse to the **same gray** on a mono printer.
- So the print band carries meaning on the channels that survive:
  - **stepped lightness**, a **defined border**, and a **hatch or dot texture**.

Impact · pilot

The figures read the same in gray.

What survives grayscale

Distinction without hue.

Borders

every fill gets a defined ink rule, so adjacent cards never merge

Lightness

a stepped gray ramp separates categories up to about five

Texture

hatch / dot / cross pattern fills carry chart & diagram series past five

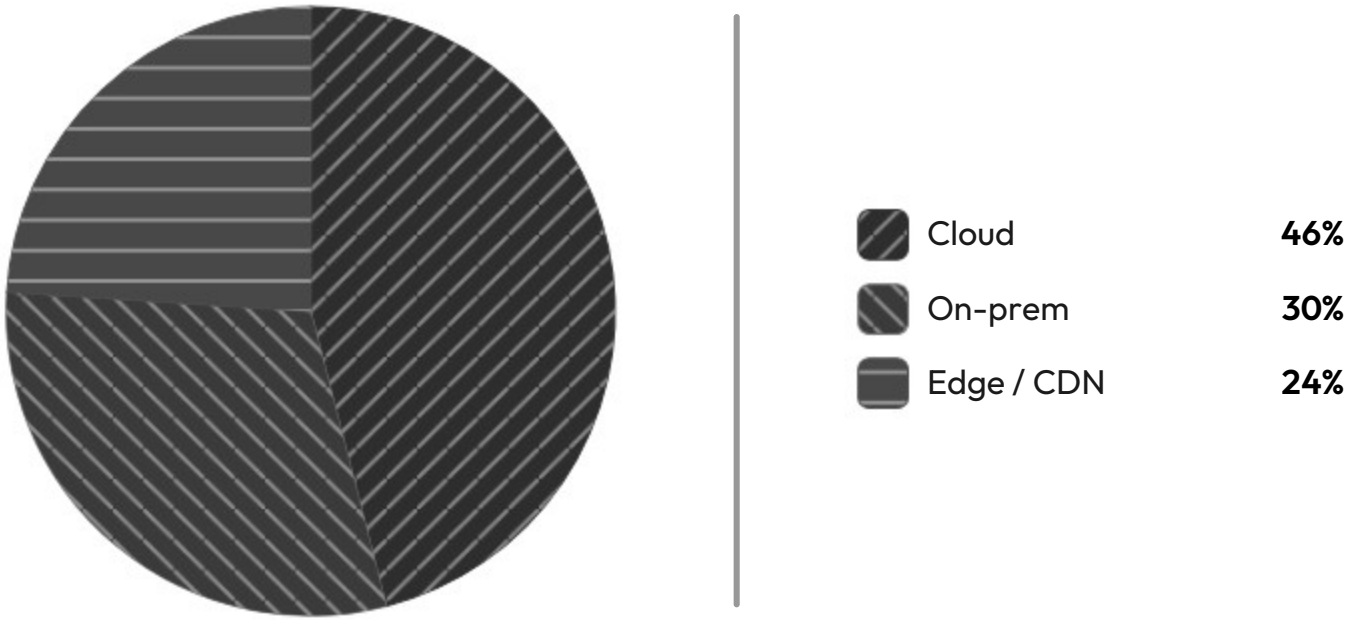

Shape & glyph

status keeps its shape mark — check, bang, cross; sentiment keeps its face

Where the budget goes

Chart series carry a texture, not a color.

The wedges differ by pattern, so the split survives a gray printer.

Print ready

One deck. Screen in color, paper in ink.

Author once; choose the surface at export. Use `color-mode: print` for the paper handout, the default palette for the projector.
