Feature · Table reflow

Responsive tables

A table that runs out of width changes shape instead of squeezing.

A record list in a narrow pane becomes one card per row.

WHAT CHANGED

Each row is one person, so each becomes a card. The first cell is the card's title; every other cell is a label and its value. Nothing in the source changed: the engine read the table as a record list and the pane's width did the rest.

A two-column table puts each label above its value.

WHAT CHANGED

A spec sheet reads in pairs. Side by side, the value column would be a few characters wide; stacked, each value gets the pane's full width.

In a half pane the same table stays a table.

WHY IT DID NOT SWITCH

A slide does not grow, and a card is taller than the row it replaces. So a table switches only where it genuinely breaks. A half pane on a 16:9 slide is wide enough, so nothing moves, and neither does a table on a full-width slide.

A quarterly table splits into runs of columns, labels repeated.

REVENUE

	Q1	Q2
Revenue	40	45
Margin	61%	62%

	Q3	Q4
Revenue	51	58
Margin	62%	63%

WHAT CHANGED

Each row is a measure and each column a quarter, so the reader compares both ways. Cards would break that. Instead the quarters split into blocks of two, and each block repeats the row labels, so Q1 still sits beside Q2. A cross-tab (region by product) takes the same layout; at the narrowest, one column per block.

An option table becomes one block per option.

WHAT CHANGED

Each column is an option, and the reader weighs one option at a time against the same criteria. So each option becomes a block, and every block lists the criteria beside its values.

A ranked list keeps rank, name and figure on one line.

TOP ACCOUNTS

RANK	ACCOUNT	ARR
1	**Northwind** SECTOR Logistics	1,240
2	**Contoso** SECTOR Retail	980
3	**Fabrikam** SECTOR Industry	860

WHAT CHANGED

The reader scans a ranking down the rank, the name and the figure. Those three stay on the first line; the other columns move to a second line under the name, each with its label.

A schedule puts each date above its milestone.

WHAT CHANGED

A schedule reads as a sequence of dates. Each date becomes a small heading over its milestone, and the owner follows as a labeled line.

Three lists in one table become three lists.

WHAT CHANGED

The columns share nothing but the row they happen to sit on, so each becomes its own list. Detection cannot tell this kind from a record list, so the author names it with `table-lists`.

An author can keep the table with one word.

THE OVERRIDE

`no-table-reflow` on the pane's marker keeps this table at every width, here a short one that fits as a table. On a slide without panes it goes in the slide's class. `table-cards`, `table-pairs` and `table-lists` force a layout instead.
