Speaker notes

Write the slide. Whisper to yourself.

A note is just an HTML comment. It rides along to the PDF and the HTML, and stays off the slide — exactly the way Marp has always treated it.

The rule

A bare comment is the note.

Genuine note

`<!-- Pause here. Ask the room. -->` rides to the PDF and HTML.

Directives

`<!-- _class: … -->` still configures the slide, never a note.

Tooling pragmas

`<!-- markdownlint-disable -->` is ignored, exactly as Marp ignores it.

Where it goes

One note, three channels.

PDF

A per-page annotation — hidden by default, `--notes-icon` to show it.

HTML

A hidden `aside.lattice-notes`, ready for a presenter view.

Sidecar

`--notes` writes a plaintext `.notes.txt`, one block per slide.

A slide with no note stays exactly as it was.

This slide carries no comment, so nothing is embedded for it — note slides and plain slides sit side by side with no change to either.

Why it travels

It degrades to nothing, everywhere.

On GitHub

A comment is invisible — the deck reads as clean Markdown.

In Marp

A comment is the speaker note — identical semantics.

In Lattice

The same comment, now embedded for the room. No new syntax to learn.

> *The slide is for them. The note is for you.*

— THE LATTICE SPEAKER-NOTES MODEL
