Turning the bar off stopped turning the panel off with it

Every slide here carries `spectrum: off`. The anchors keep the surface they paint for themselves.

Section 01

The rule was clearing a bar and repainting a canvas.

Section 01 · What it said

One shorthand, two effects

The shorthand clears every background longhand at once — which is how you remove a bar — and restates the color, which is how you lose a panel.

What it said How to fix it The accent stripe

LOWER THE SPECIFICITY

The rule stops out-specifying the frame, but it also stops beating everything else it was written to beat.

Say only what you mean →

Decision · How to fix it

SAY ONLY WHAT YOU MEAN

`background-image: none` removes the bar and touches no color, so no frame needs a carve-out at all.

MEASURED

What the anchors looked like before

The supporting detail →

What the anchors looked like before

On main

`title`, `topic` and `closing` read `rgb(0,29,51)` — the deck ground, not the panel.

On this branch →

What the anchors looked like before

On this branch

All three read `rgb(0,61,102)`, off a real render, under `spectrum: off` and `spectrum-edge: left` alike.

Section 02 · The accent stripe

was the same rule

`accent` again

It draws a stripe, and copied a canvas out of the rule it replaced.

Section 02

The structural accents were never the problem — and still are not.

Three rules, one lesson: declare the thing you mean, not the thing that resets it.
