Fix · split-panel · split-compare

Split panels hold their frame

The running chrome stays on its field, and the finish covers both sides.

WHY LATTICE

Drag-the-box tools vs. a deck that is already designed.

Both put pixels on a slide. Only one keeps its taste when the content changes.

SLIDE EDITORS	LATTICE
• You place every box, line, and color by hand • Restyling means re-touching slides one by one • Consistency depends on whoever edited last	• You write the content; the engine composes the slide • One theme restyles the whole deck, every slide at once • The design system holds the line on every slide

RECOMMENDATION

Chrome ends at the rail; the finish runs across both sides.

WHAT CHANGED

The chrome stays on the field it starts on.

The header and footer used to cross the seam in the panel's ink, where they vanished.

One line, one budget

A long line ends in an ellipsis at the panel's edge.

A band the panel keeps clear

The heading can never grow into the chrome.

The author still hears about it

The export names the cut; the reader sees no pill.

F

Finish lands on the accent.

The panel keeps its field and its own copy of the finish

The field stays solid

The accent panel is still the accent panel.

The texture reads on top

Strata's dots sit on the field, as on a title slide.

The content side has no background

The slide's finish shows through it.

> **The mirror budgets the other side**
>
> The chrome stops where the panel begins.

> **The footer is chrome again**
>
> It stays a slide child, so `no-footer` reaches it.

SPLIT-PANEL METRIC MIRROR

3 fixes

Header budget, the finish on the panel, and the footer split-compare used to drop.

LEVEL 3 · APPLYING

The tint stays the tint.

Does the category still read?

A proof panel keeps its category color, and the finish is composed against that color.

YOU KNOW YOU'RE HERE WHEN

The panel tint still names the stage on a finish deck.

THE FINISH FOLLOWS THE FIELD

Its texture is mixed toward the tint, not the canvas.

THE EDGE BAR KEEPS ITS HUE

The category mark still runs along the top.

BACKDROP: CLEAR

Clear works on both sides.

Each side clears behind its own content, and the finish stays in its margins, as on an anchor slide.

The points read on clean canvas

The finish frames them instead of running under the text.

The panel keeps its field

Its own finish fades out behind the heading.

DARK SLIDE

The same rules hold on a dark slide.

A per-slide `dark` composes with the finish and the chrome budget.

BEFORE

- Opaque fields hid the finish
- Chrome crossed the seam

AFTER

- The finish covers both sides
- Chrome ends at the rail

RECOMMENDATION

Without a `finish:`, the split renders exactly as before.

Split panels · fix

Every split slide keeps its frame, finish or not.
