Forms invariant · #1598

One box, one inset

Chart and diagram paid the frame inset twice. Every figure after this slide is 128px wider.

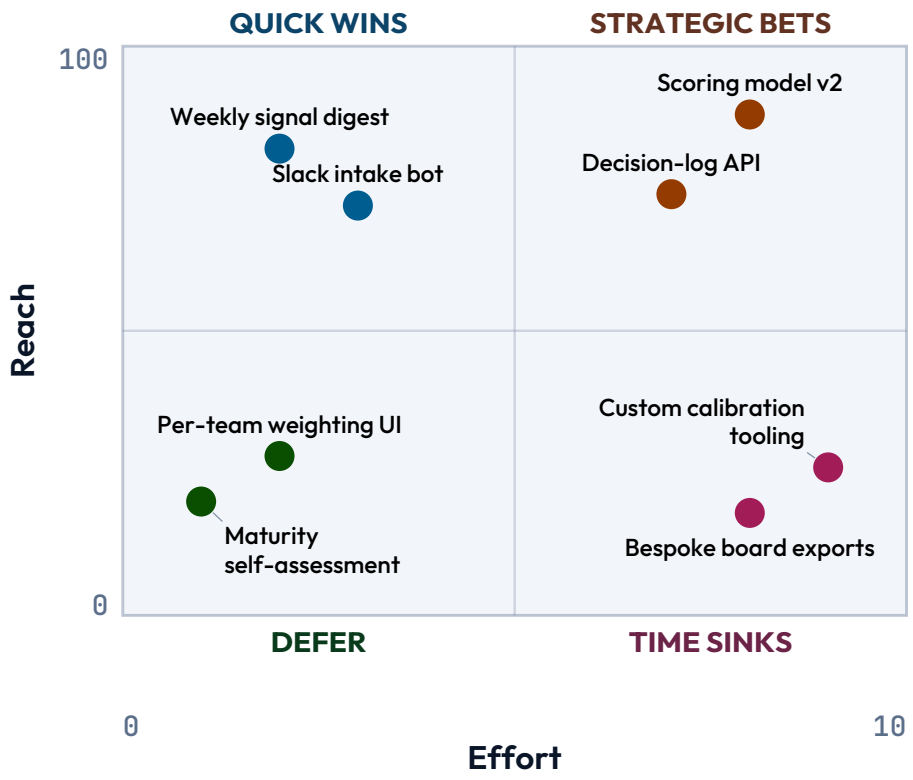

Six buckets, one rule, two that broke it.

BUCKET	BODY ELEMENT	INSETS IN THE CHAIN	BODY BOX	PAINTED CONTENT
Prose	`p`	stage only	64	64
Code	`pre`	stage + the block's own padding	64	88
Masthead	band	stage; `padding-bottom` only	64	64
Footer	band	positional, no padding	30	30
Diagram	`.mermaid-svg`	stage **+ a width calc**	128	128
Chart	`.chart-body`	stage **+ a calc + padding**	128	**192**

✦ *Measured on a 1280×720 indaco render — distance in px from the slide edge, before the fix.*

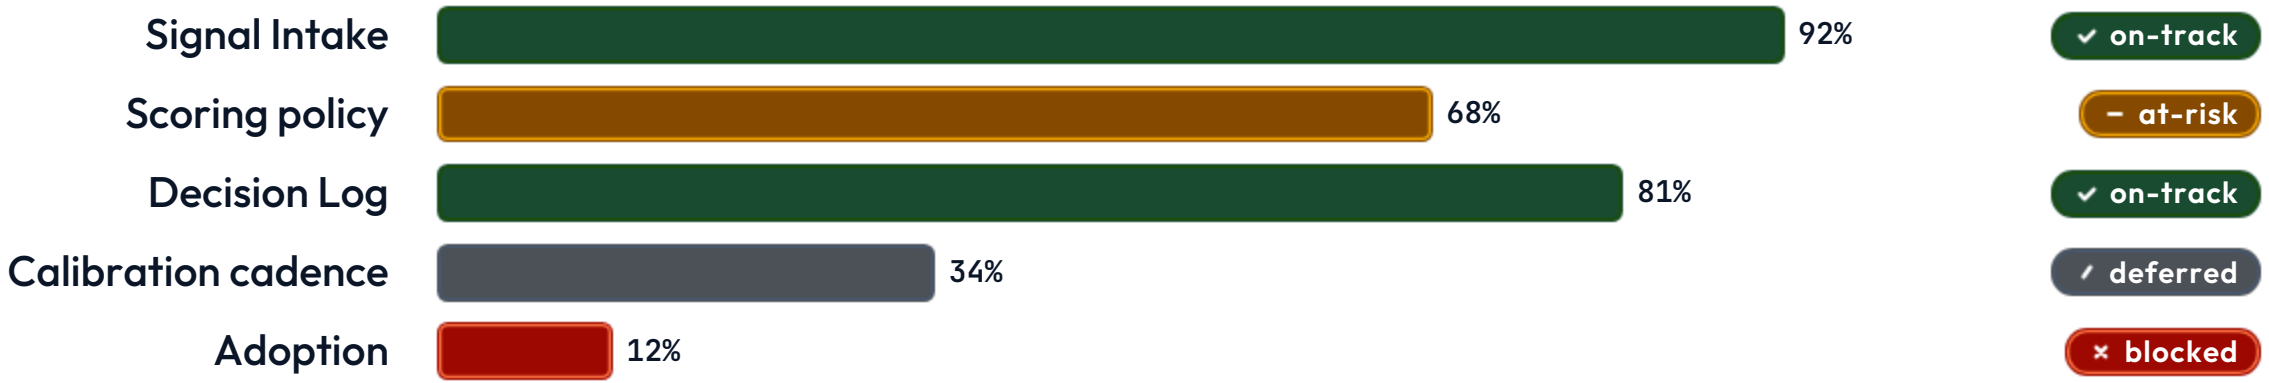

An SVG chart keeps its ink and gains its box.

The figure box goes 896 to 1024; the letterboxed drawing is height-bound, so the room around it changes, not the mark.

H1 2026 · Phase 1 readiness

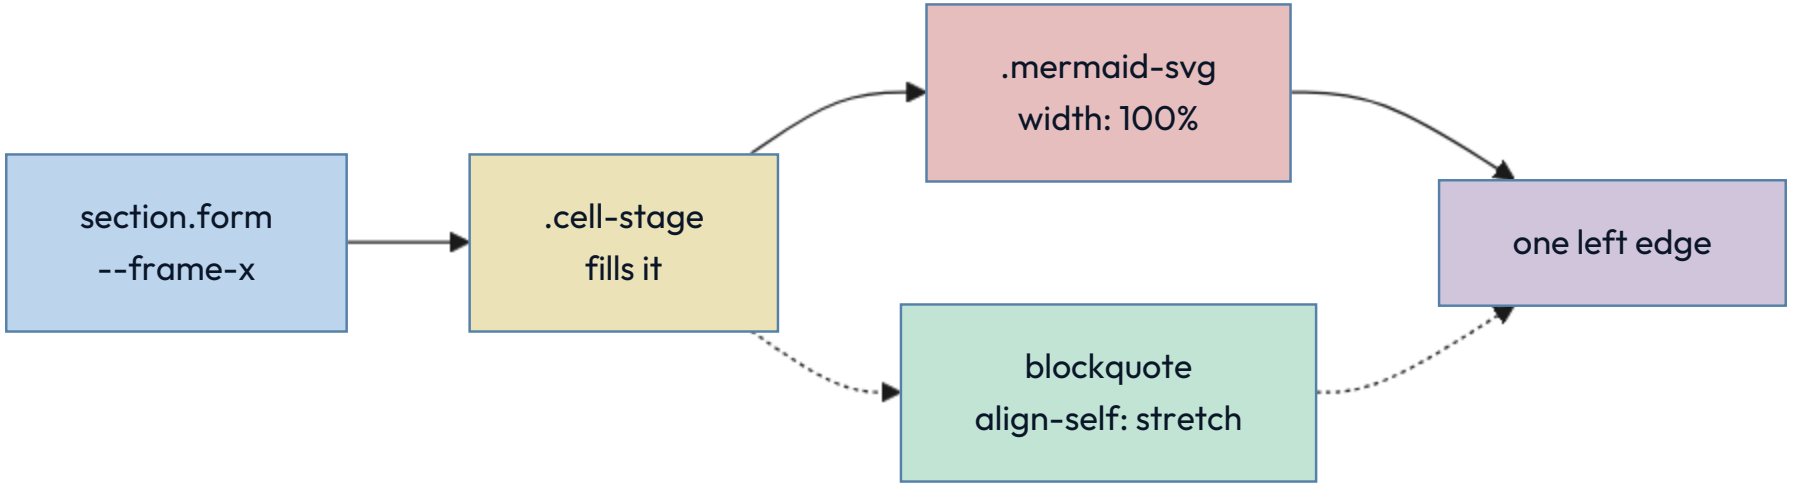

An HTML-bodied chart spends the width on its bars.

Architecture · The box chain

The diagram now starts where its title does.

One inset, owned by the frame — not two

KEY INSIGHT

This panel always sat at the frame inset. The diagram sat 64px inside it — out of line with its own title.

The second clause

A body owns padding only when it paints.

- Code earns it
  - Its `pre` paints a surface, and text must not touch a visible edge.
- The chart canvas earns it
  - The opt-in `canvas` glass panel now carries its own inset in the `.canvas` rule, where the surface actually exists.
- A bare chart does not
  - Nothing is painted under it, so nothing is owed. That was 64px per side on every chart, for a panel no committed deck draws.

✦ *The gate tests this by measurement — a non-transparent background, a background image, or a real border — not by a class list.*

design/forms.md §6.1

The inset is one number, in one place.

Two gates keep it there: a browser-free ratchet in `build:check`, and a measured assertion at three deck sizes.
