Lattice · Feature deck

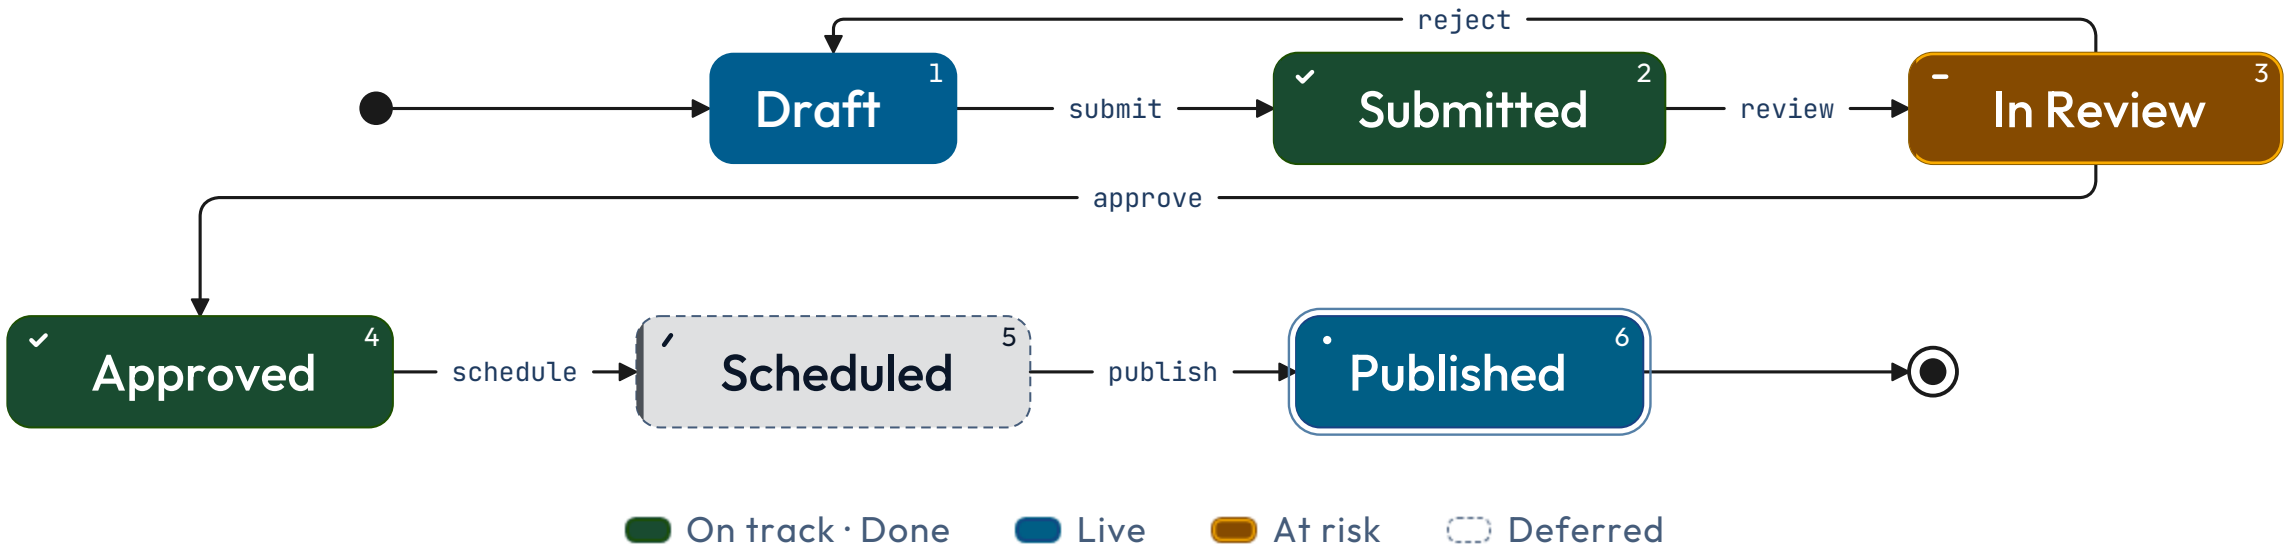

State charts that use the whole stage.

A status paints the state, and a long machine wraps in reading order instead of shrinking.

Status paints the state

A status reads on the state itself.

The same fill, edge and leading accent a gantt bar wears. A state with no status is a quiet tile.

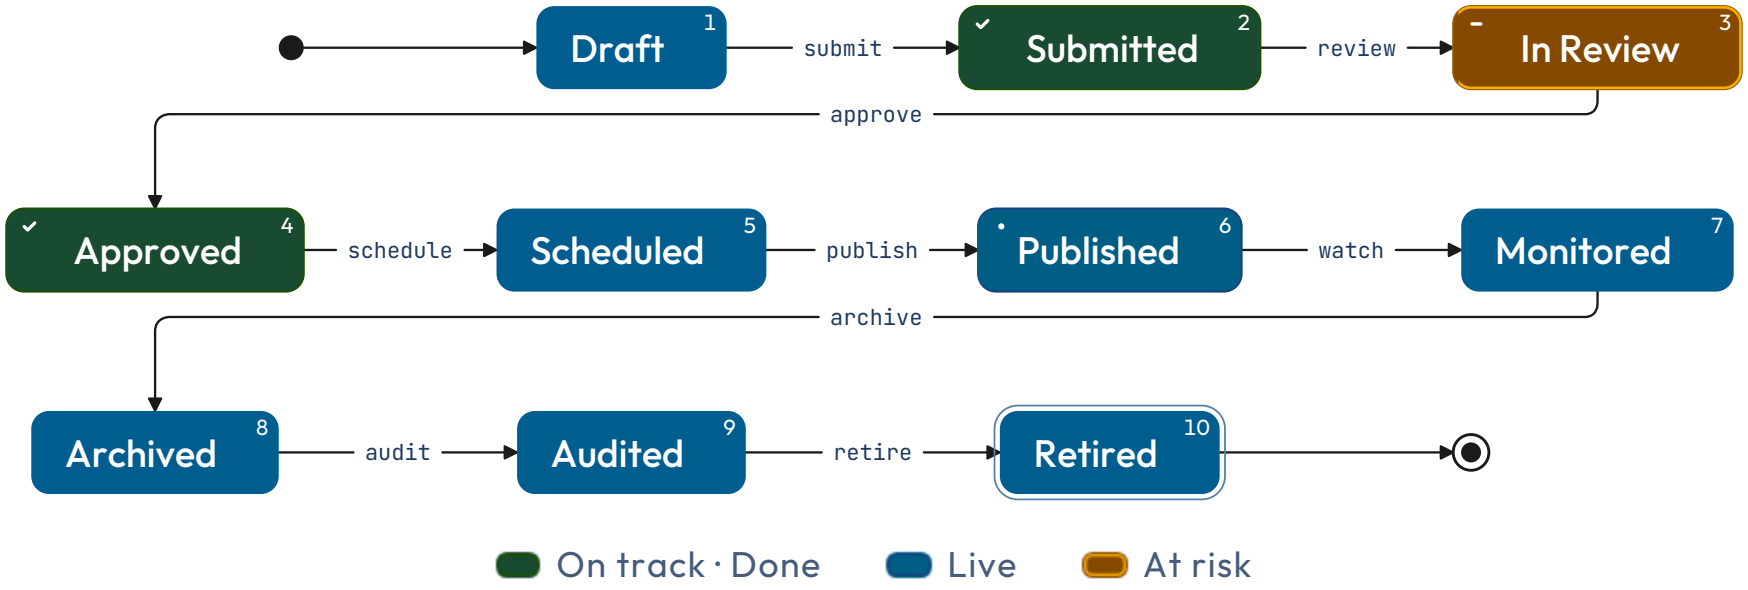

Deferred draws hollow and dashed, so it never reads as "no status".

Reading-order wrap

Ten states wrap instead of shrinking.

Each row reads left to right, and one connector drops to the next.

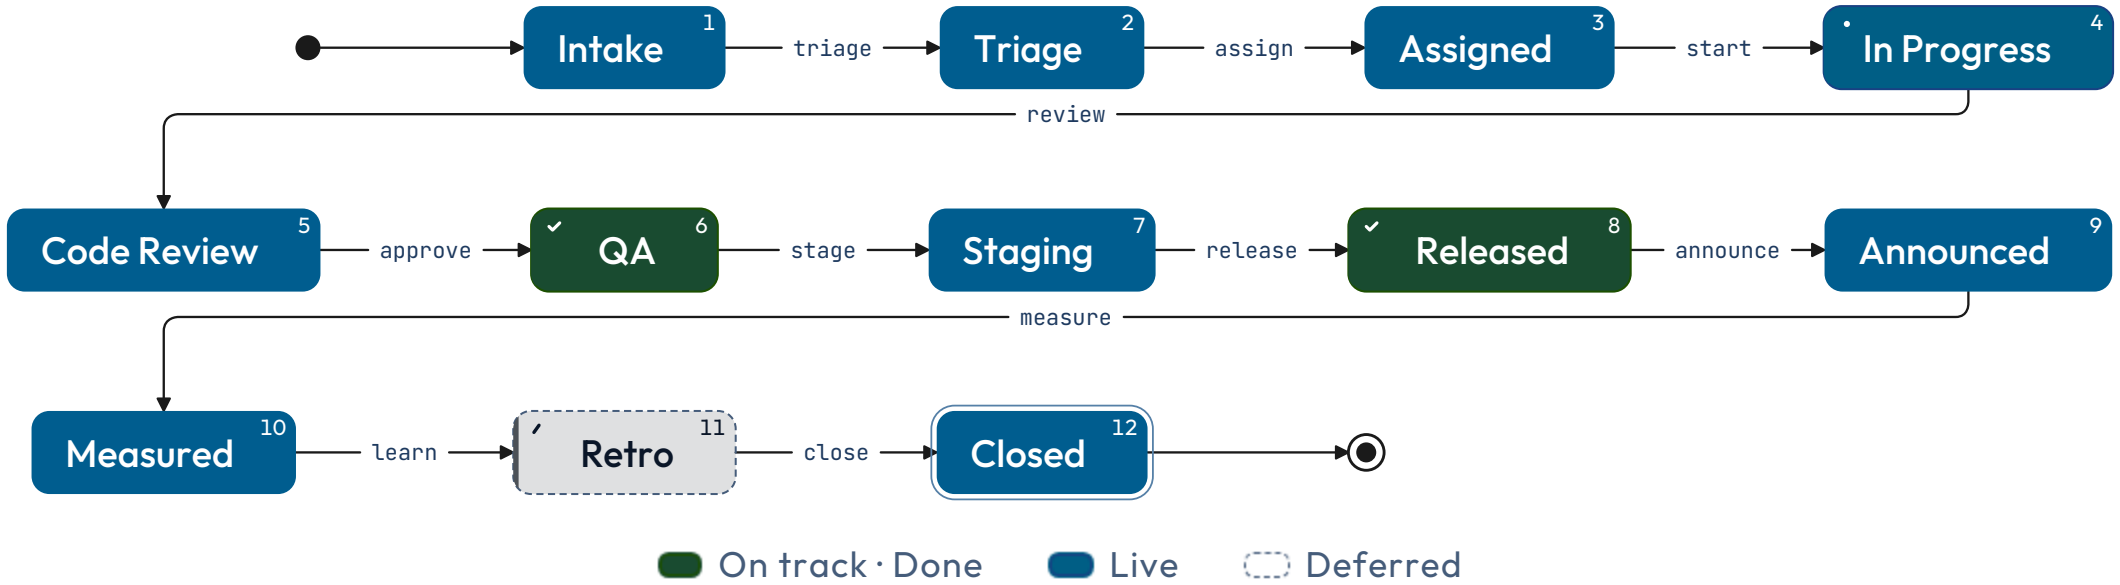

As a single column these names set at 4.6px on this stage.

Reading-order wrap

Twelve states still read.

The chart scores every row count and keeps the one that sets the type largest.

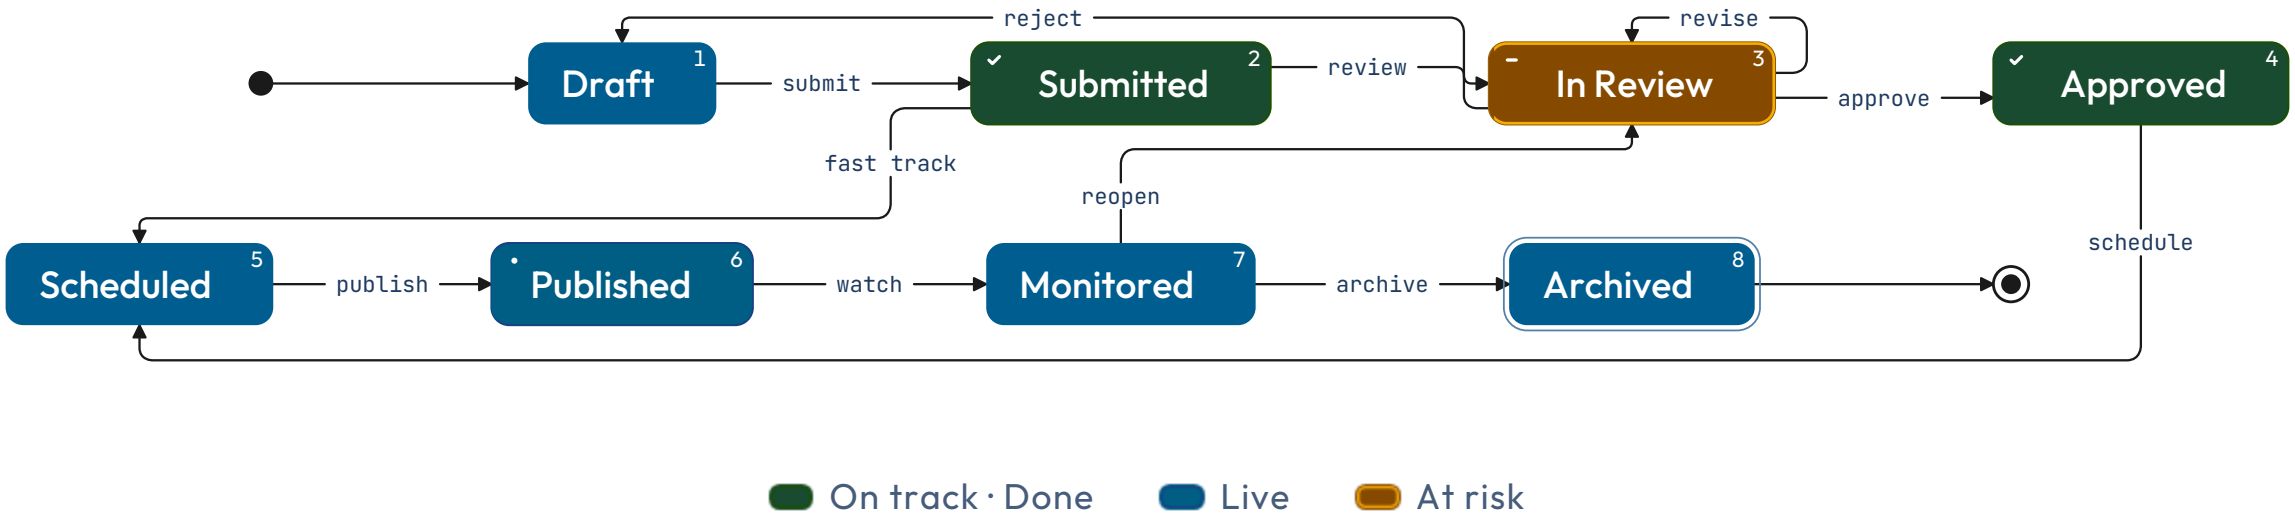

A short chain stays on one row: wrapping has to buy a real gain in type size.

Loops

Loops nest; they don't cross.

Back-edges ride above their row, skips below, and each lane is ordered against the rest.

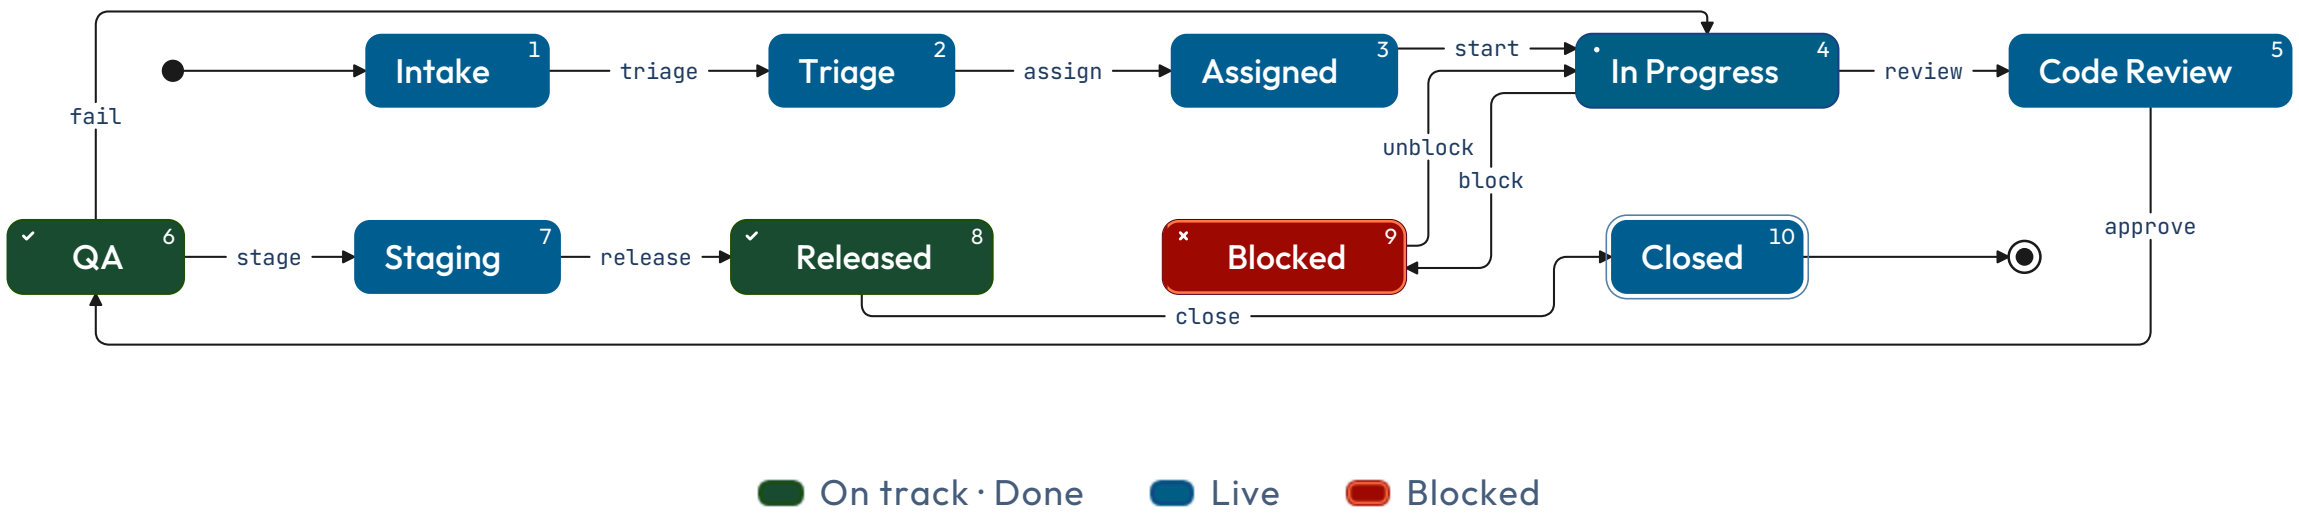

Every label sits beside its own line, never on another.

Branching

A long pipeline with one fork wraps too.

dagre cannot wrap, so a wrapped layout competes with it and wins only by a clear margin.

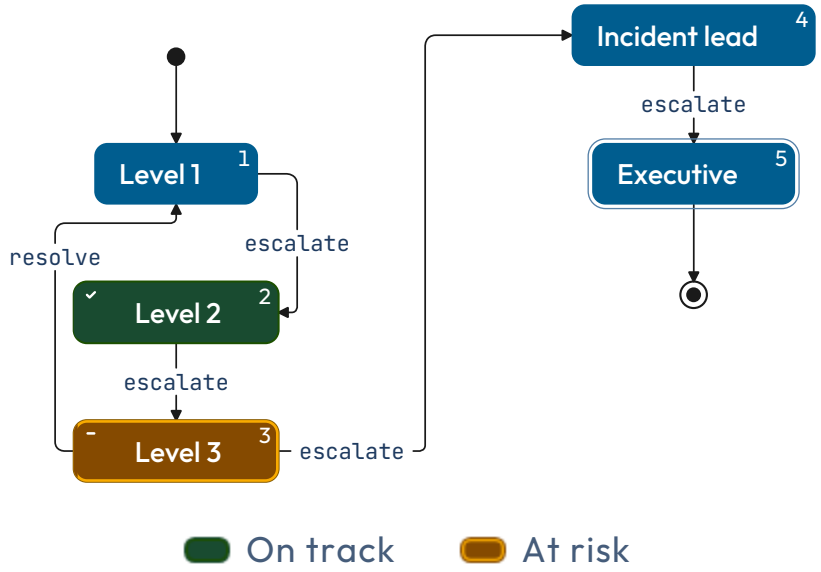

A fan-out that reads best as parallel ranks still goes to dagre.

Direction

Pin the direction when it carries meaning.

`tb` *keeps a ladder top to bottom on a wide stage; it still wraps into columns.*

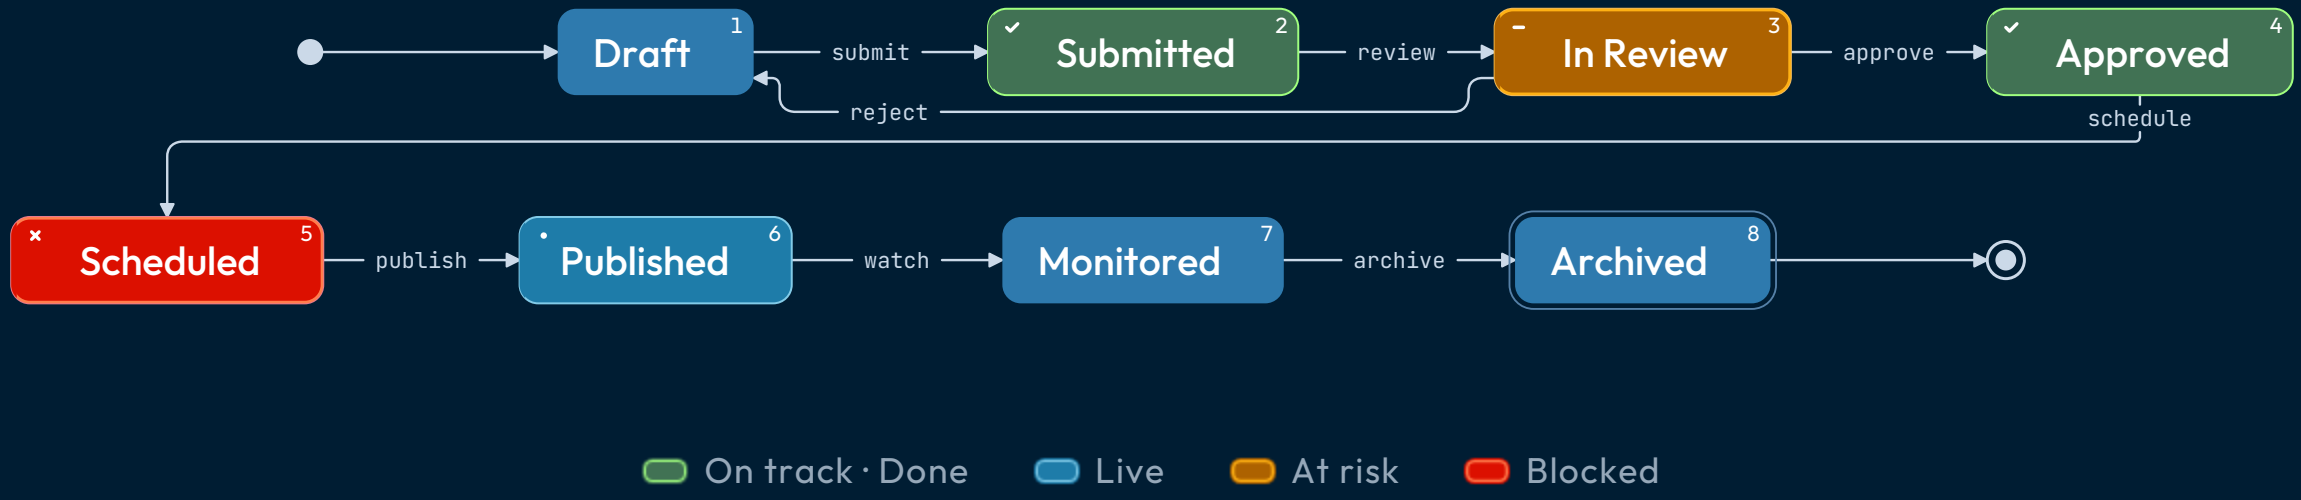

A row pins the same way. With neither, the stage's shape decides.

Dark mode

The same chart on a dark canvas.

Status tiles use the pill's stops, so every state name clears 4.5:1 on every theme.

The ordinal takes the name's ink on a status tile, so it holds contrast too.
