Universal token system · Phase 3

Two honest axes, not three muddled ones.

One status vocabulary for the whole engine — and a separate, semantic name for the diagram lifecycle it was tangled with.

Status is not lifecycle.

Status axis

`--status-pass` / `-warn` / `-fail` / `-info` / `-mute` — one vocabulary shared by the state-discs and the charts.

Diagram lifecycle

`--diagram-active` / `-done` / `-critical` — gantt task states, named for what they mean.

Annotation

`--diagram-today` (the today line) and `--diagram-note` (aside surfaces).

Why split

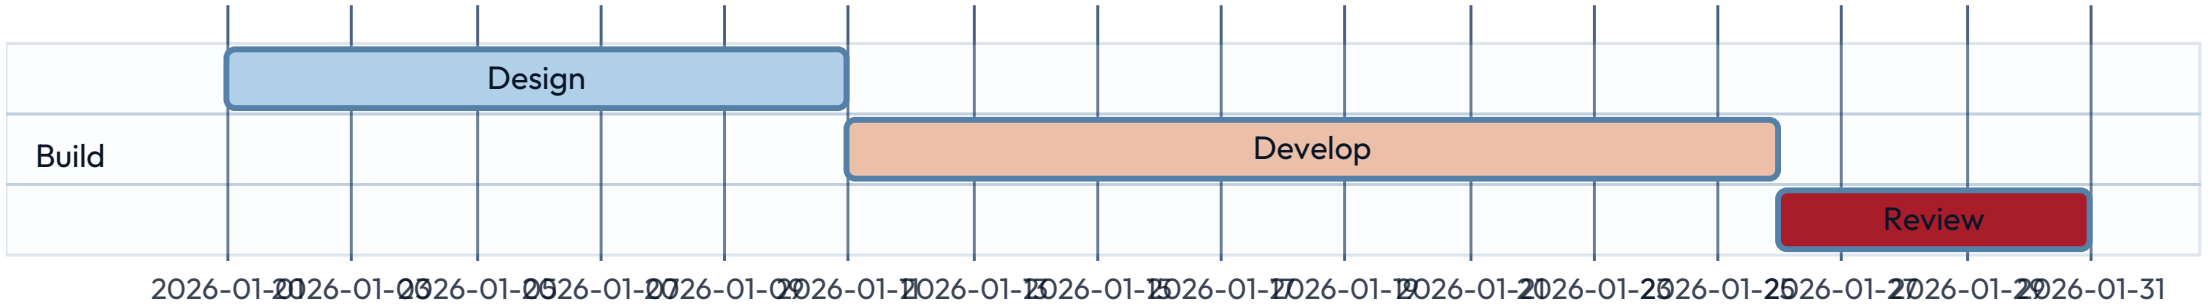

A gantt "in-progress" tone is not a "warn". Forcing them into one set was the magic; two axes is the truth.

Status axis — the state-discs.

- Signal taxonomy ratified
- Decision log live in staging
- Pilot teams trained, two still circling back
- Exec sponsor confirmed for launch comms
- ~~Legacy export path — waived for v1~~

01 · Gantt

Diagram lifecycle — active, done, critical.

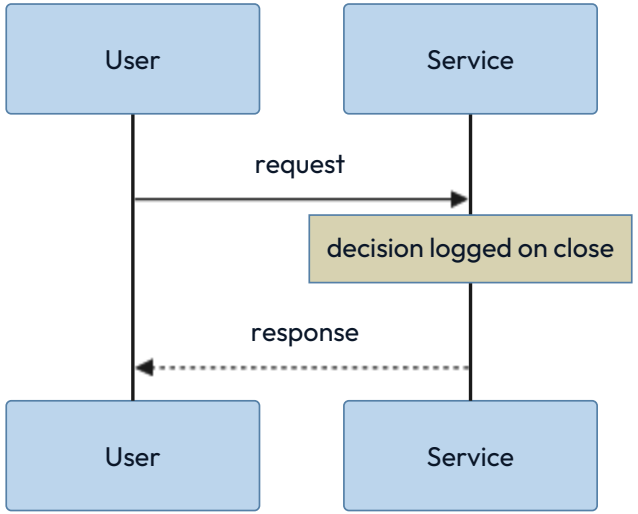

KEY INSIGHT

Bars read `--diagram-done` / `--diagram-active` / `--diagram-critical` (each with its paired `-mark` stroke); the today line reads `--diagram-today`.

02 · Sequence + note

Annotation — note surface and today highlight.

KEY INSIGHT

The note surface reads `--diagram-note`; its border borrows the `--diagram-today` highlight — value reuse made explicit, not hidden.

Phase 3 of 7 · see engineering/decisions/2026-06-11-universal-token-system.md

One status vocabulary; an honest lifecycle.
