funnel

Tapering stages that show where a flow drops off, with the conversion rate between each.

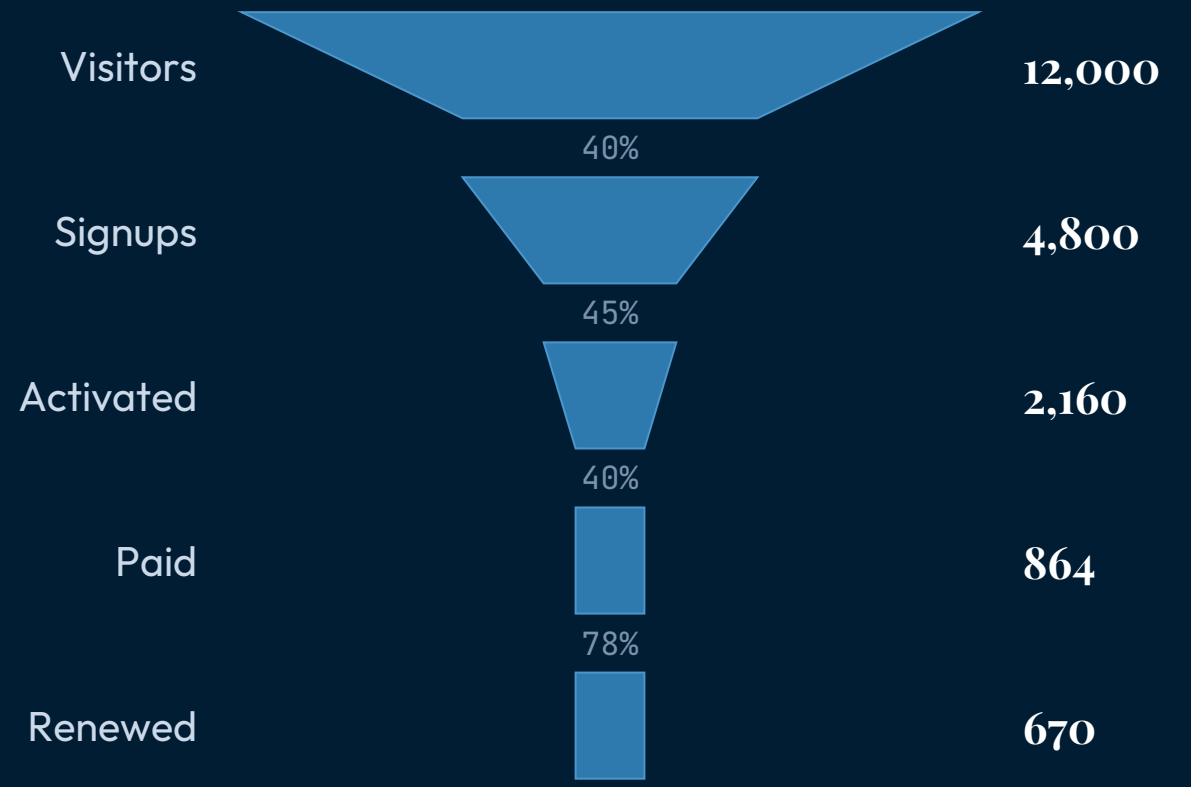

The funnel narrows; the width is the story.

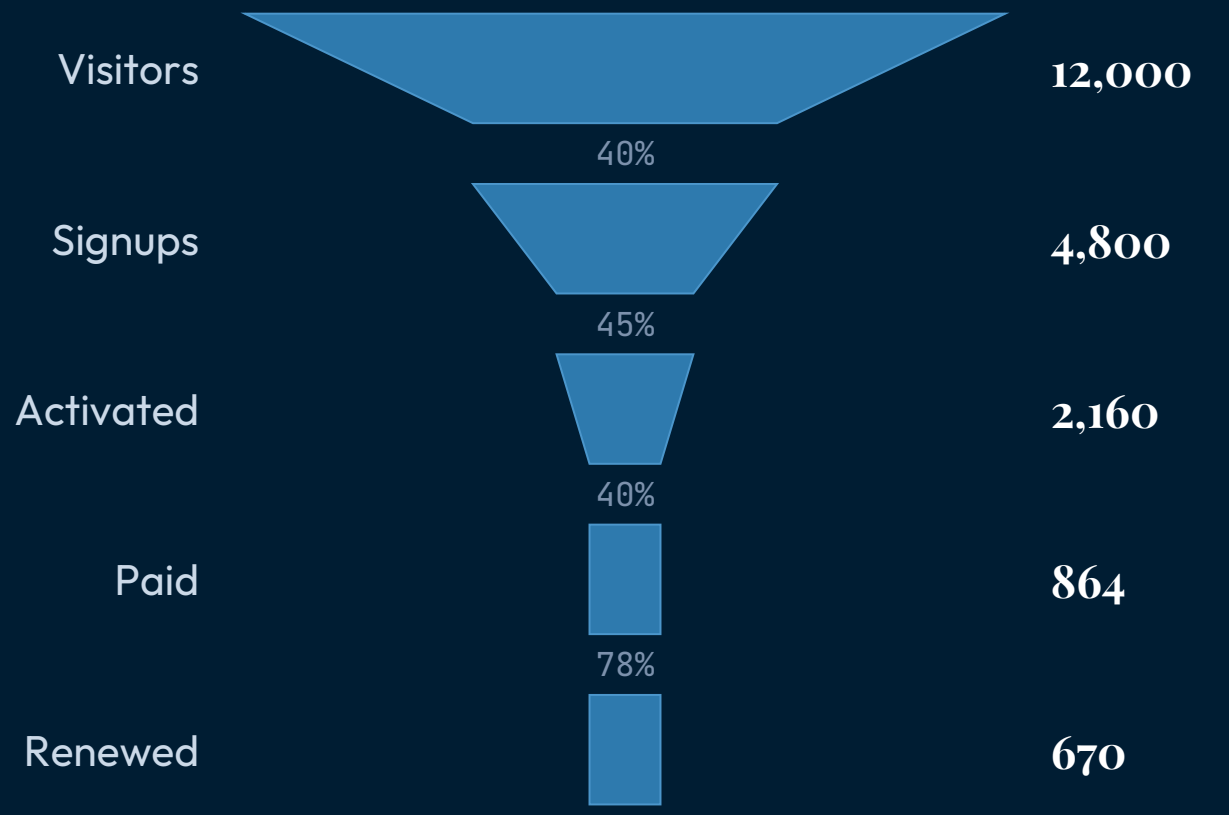

Seven stages, a steep early drop.

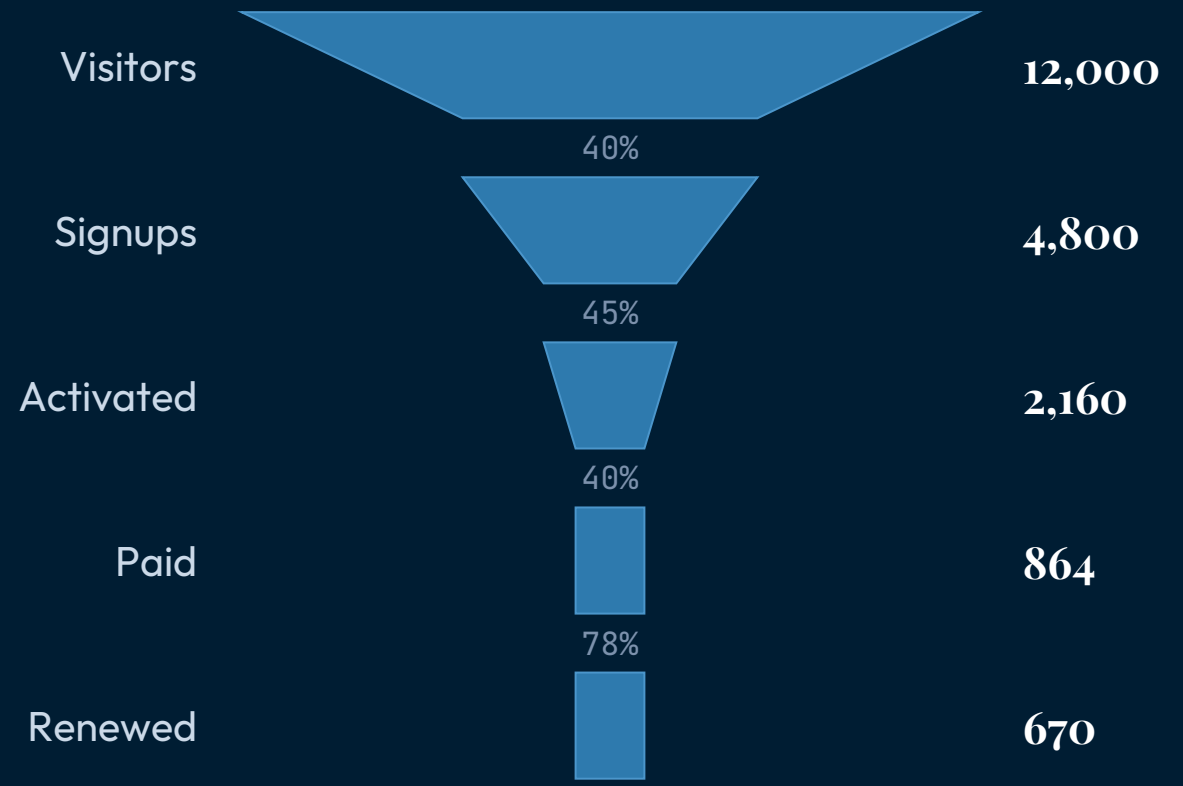

The funnel narrows; the width is the story.

The funnel narrows; the width is the story.

The funnel narrows; the width is the story.

When NOT to reach for funnel.

Stages that aren't a subset

If a later stage can exceed an earlier one (it's a category breakdown, not a pipeline), the taper lies. Use `piechart` for parts of a whole or `progress` for independent metrics.

A funnel of two stages

Two bands is a single conversion rate dressed up as a chart. State it as a `big-number` ('18% convert') or a two-tile `stats` instead.

Non-monotonic values

Values that rise and fall make the trapezoids bulge and the conversion %s read oddly. A funnel assumes a monotonic narrowing; for an up-and-down series use a `progress` or a chart with an axis.

Related components

See also.

`progress` — independent metrics as labeled bars, not a narrowing pipeline

`stats` — a row of headline figures with no drop-off relationship

`piechart` — parts of a single whole rather than sequential stages

`list-steps` — the stages are a process to walk through, not values to compare

`big-number` — a single conversion rate is the whole story
