Motion that carries meaning

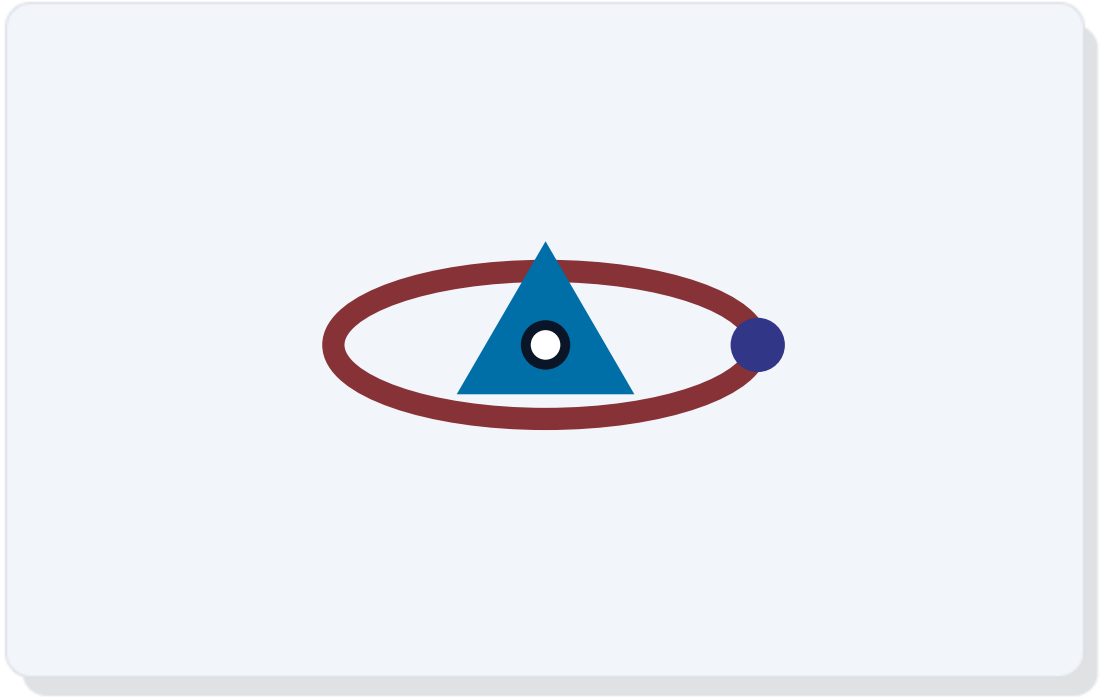

A `scene` slide freezes an Anima poster into the PDF — and on the HTML/present surfaces, the poster comes alive. You author the motion as an `anima` spec beside the still; the deck shows the still in print and the living scene on screen.

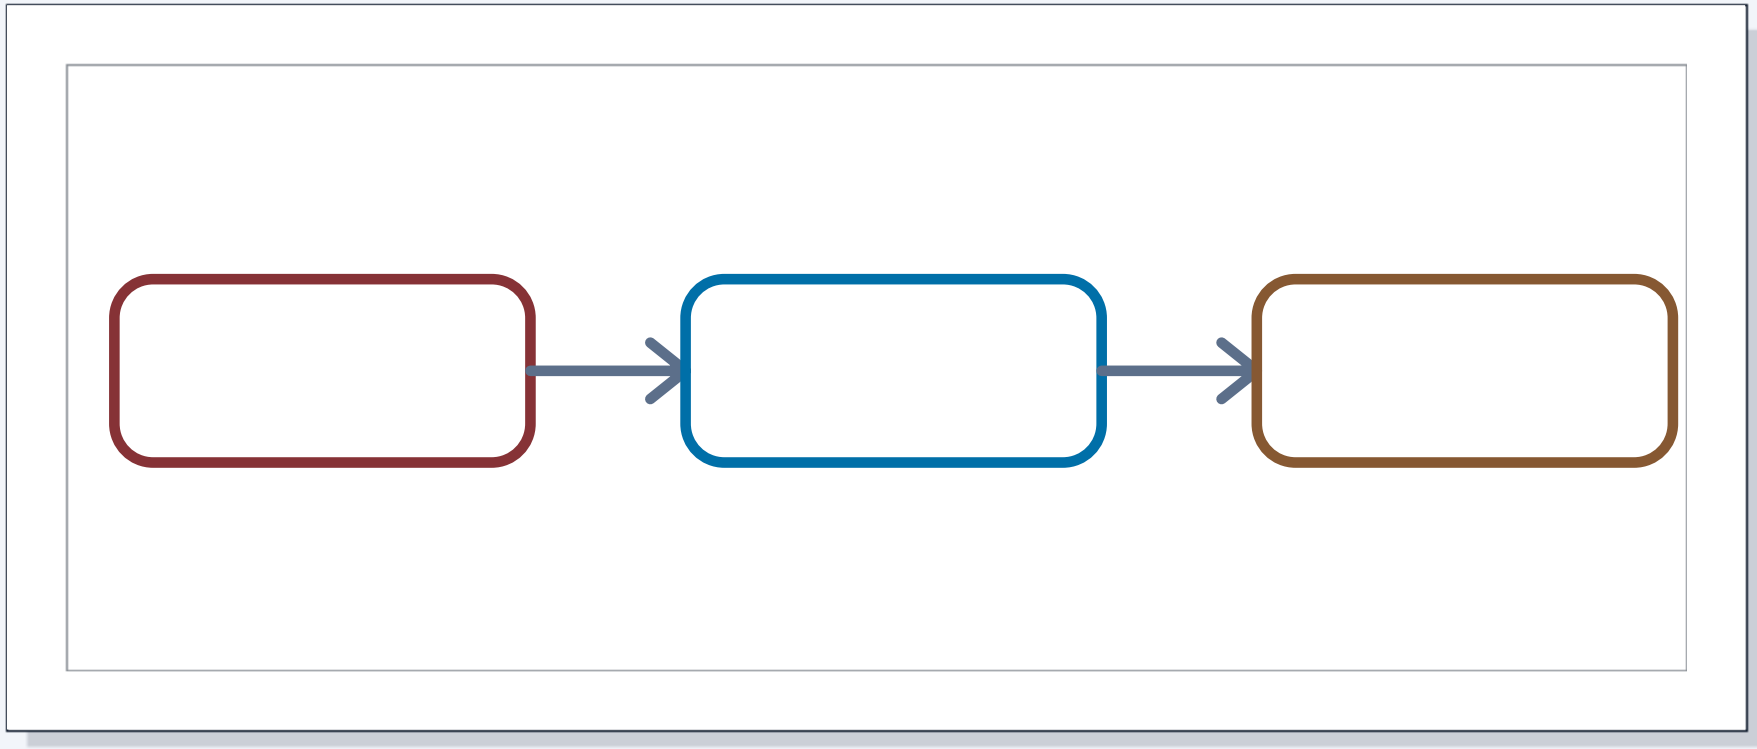

The premise

The still is the fallback. The motion is the argument.

The rotor turns inside its fixed housing.

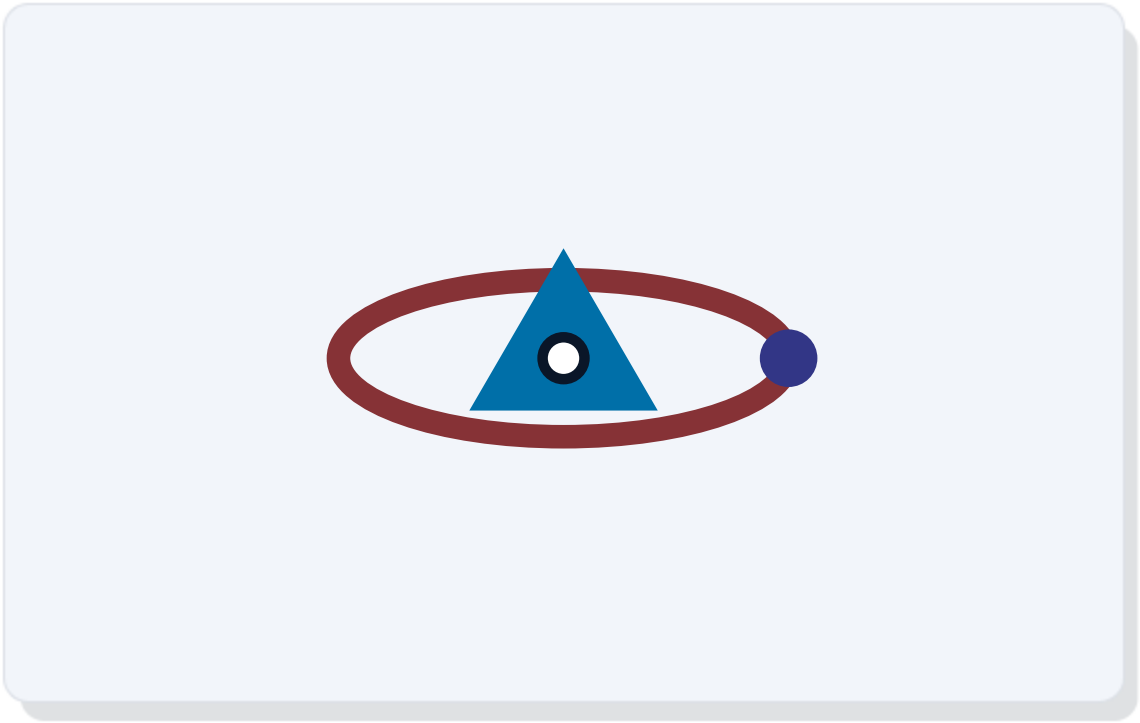

A relationship a single still can only imply: on screen the rotor spins and a bead orbits the ring; on paper this hero frame holds.

The pipeline assembles in order.

The drawing ORDER is the meaning — node, arrow, node — which a static diagram can only present all-at-once. On screen it strokes itself into being.

Every scene reduces to its still.

Under `prefers-reduced-motion`, the vestibular spin doesn't autoplay — a scene whose whole point is the sweep falls back to this poster, now with a **Play the motion** control so a reader who wants it can still opt in. The default respects the reader; the choice stays theirs.

One markdown. A poster in print, a living scene on screen.

`<!-- _class: scene -->` *+ a poster SVG + an* `anima` *spec. The PDF freezes the still; the Playground and present surfaces bring it to life, recolored to whatever theme frames it, and always reducible to the still.*
