Feature · chart narration parity

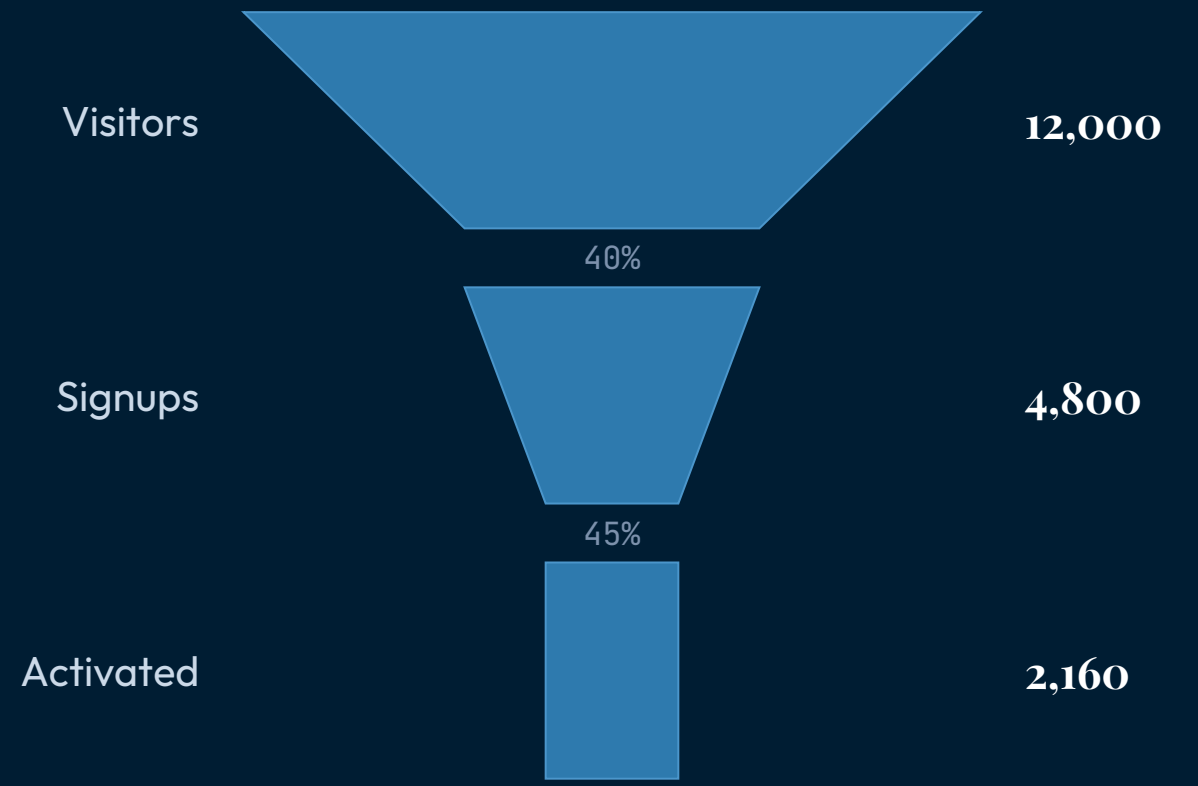

Charts read themselves aloud — the same way live and in the export.

A chart's real insight is a number the render computes — a conversion rate, an axis scale, an inferred start state. Those now narrate identically in Studio Present and in the exported `.vtt`.

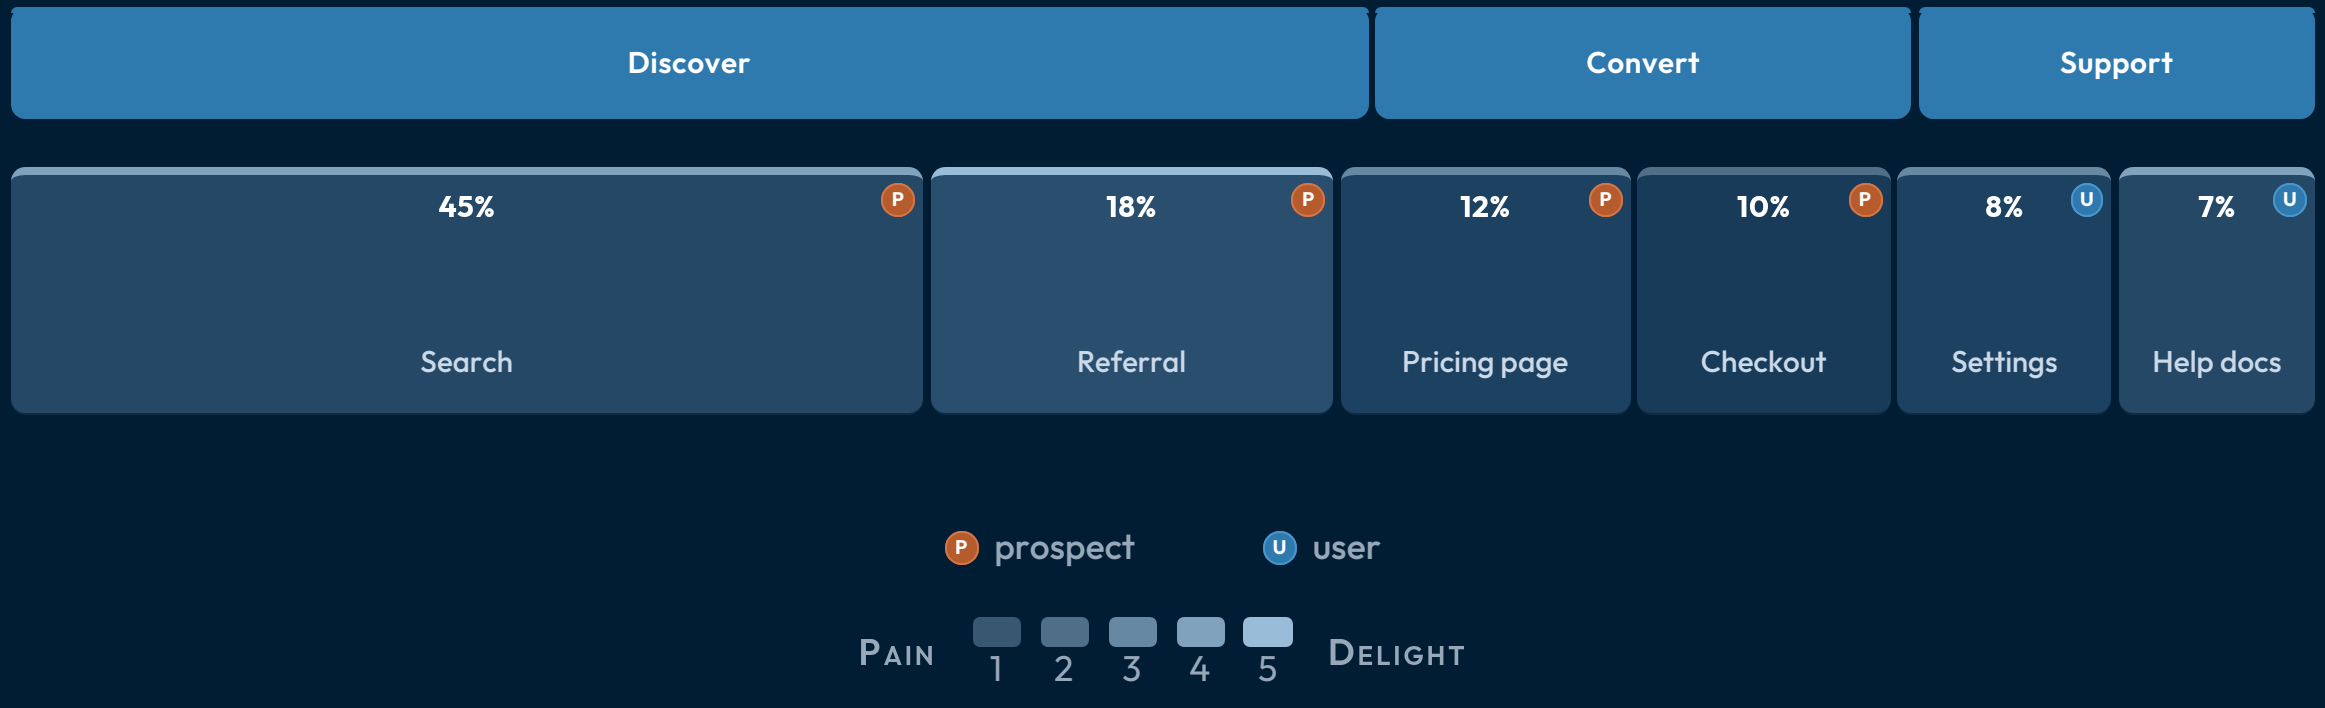

The insight isn't in the words — it's in the picture.

A funnel slide lists stage counts, but the number that matters — how much of each stage carries to the next — is computed at render time and drawn into the chart. A caption built from the slide's prose alone never sees it.

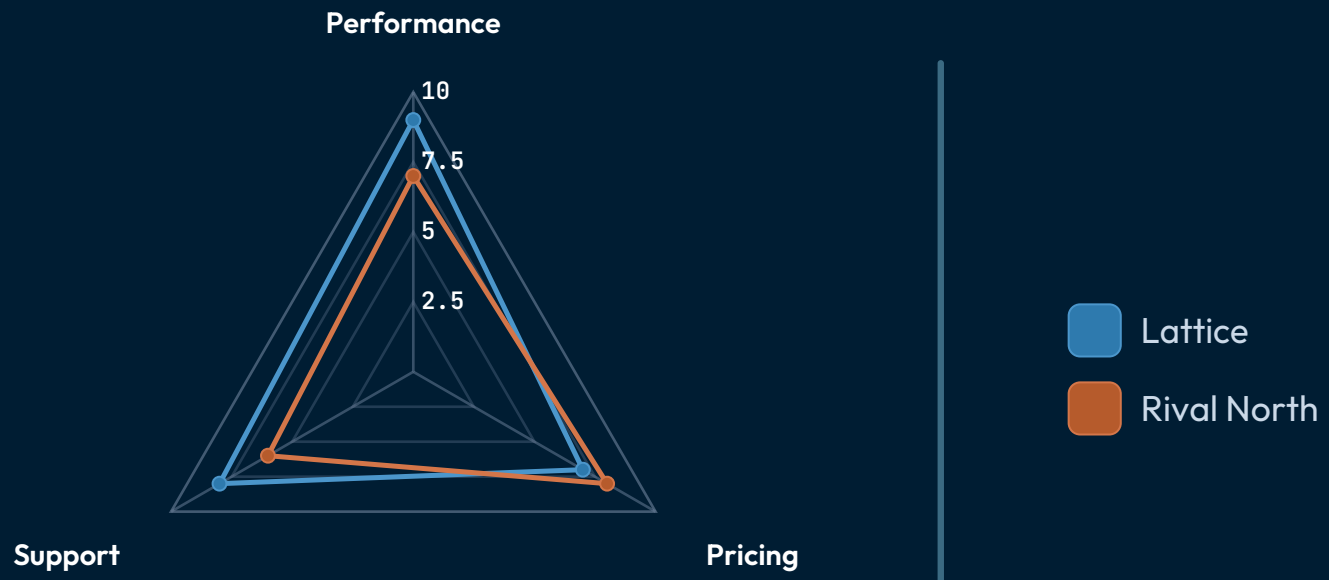

Where the flow drops off.

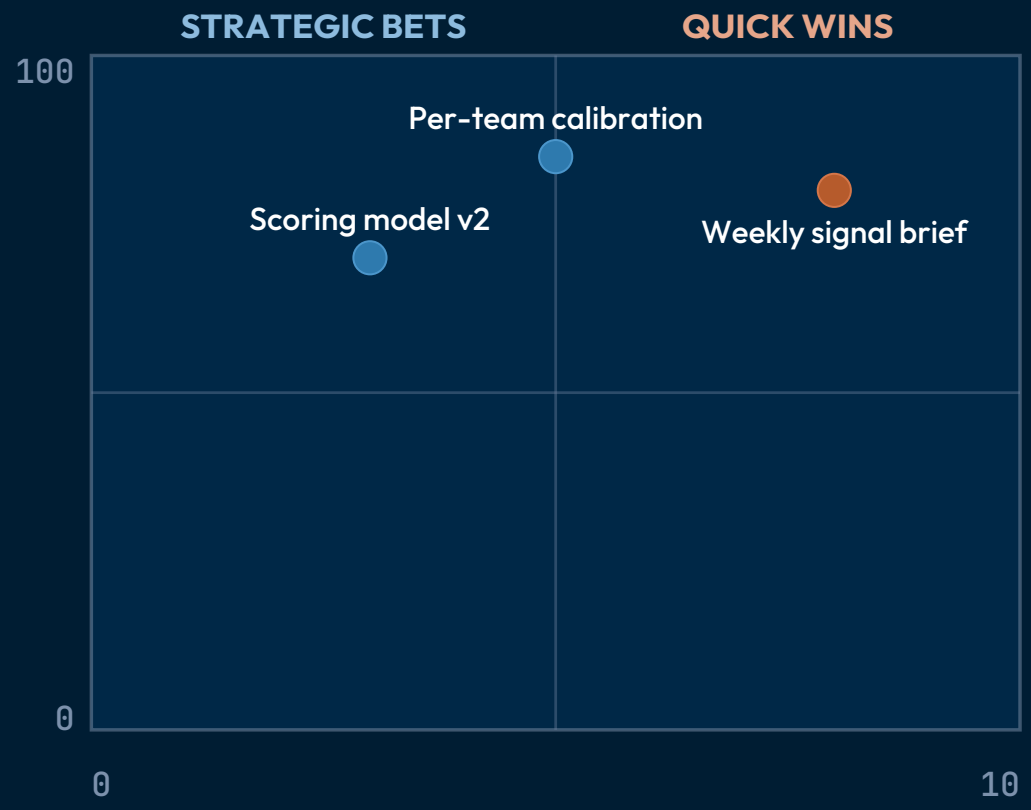

weighted sizes each step by its share of the whole.

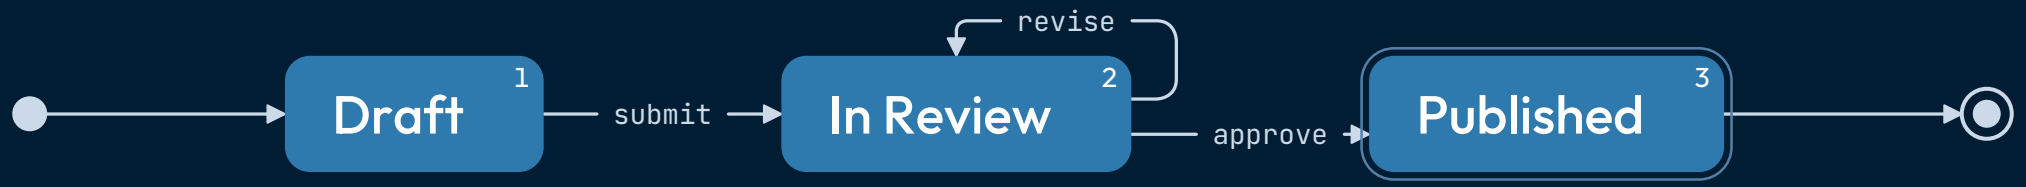

How we stack up across the buying criteria.

Where to put the next dollar.

The approval flow, and where it starts and ends.

One kernel, two surfaces — no drift.

The narrators live once in `lib/core`; live Present and the `--captions` export both call the same kernel. An inline `<!-- say: -->` or a front-matter `say:` entry still wins — the chart narrator only speaks when the author has not overridden the slide.
