Feature · the code plugin

Code reads the same on every slide.

Highlighting is a plugin now. Any fence on any slide sits on the code panel, colored by the theme's syntax roles, and a one-line record above the fence turns on numbers, focus and diff bands.

A fence on an ordinary slide gets the panel.

Before this change, a fence outside the `code` layout painted its syntax colors straight onto the slide, where the pale ones were unreadable on a light theme.

```
export async function load(id: string): Promise<User> {
  const hit = cache.get(id);
  if (hit) return hit;
  return api.get(`/users/${id}`);
}
```

A record above the fence configures the block.

src/session.ts

```ts
import { sign } from "./keys";

export function issue(user: User): Session {
  const expires = Date.now() + TTL;
  const token = sign({ sub: user.id, exp: expires });
  return { token, expires };
}
```

A diff block bands each added and removed line.

retry.py

```
  def fetch(url):
-     return requests.get(url)
+     for attempt in range(3):
+         try:
+             return requests.get(url, timeout=5)
+         except Timeout:
+             sleep(2 ** attempt)
```

Each line's `+` or `-` sets its band; the rest of the line is colored as Python.

A command list colors its commands and flags.

```
npm install @laticent/lattice
docker compose up -d --build
kubectl apply -f k8s/ --namespace prod
terraform apply -auto-approve -var-file=prod.tfvars
```

Stock highlight.js left this block gray. Lattice's shell grammar colors the commands and flags, in the Studio, the PDF and an Export to Marp.

One command formats every block.

```
const total = items
  .filter((i) => i.active)
  .reduce((sum, i) => sum + i.price * i.qty, 0);
```

This was one minified line. `lattice fmt`, or **Format code blocks** in the Studio, rewrote it at the record's 48 columns, so the source, the slide and every export show the same lines.

Each language gets its own formatter.

```sql
select
  region,
  sum(amount) as revenue
from
  orders
where
  placed_at > '2026-01-01'
group by
  region
```

Prettier, ruff and sql-formatter each load only when you format a block in their language.

Mark a line without dimming the rest.

```
service: billing
replicas: 3
image: registry.laticent.dev/billing:2.14.0
command: ["billing", "--listen=0.0.0.0:8080", "--db=postgres://billing@db.internal:5432/billing", "--
  cache=redis://cache.internal:6379/0"]
```

`mark=` tints a line and keeps every other line at full strength. `wrap` breaks a long line instead of clipping it.

Copy buttons, where people read.

```
npx lattice fmt deck.md --check
```

`copy` puts two buttons on a block in the Studio, the Playground and the exported webpage: copy the code, or copy it as colored HTML. A PDF like this one never shows them.

code-plugin · code-format

Any fence, any slide, one record.
