inventory · ledger · ordinal placement

The index rides the title

A portrait ledger auto-splits to one row per page. The ordinal now hangs off the
row's title, so it sits on that title's line at any row height.

INVENTORY · THE PARTS LEDGER

Three rows, one per page.

The ordinal indexes the row →

inventory · the parts ledger

Three rows, one per page.

---

01 The ordinal indexes the row.

So it belongs on the row's title line.

A split page is page-tall →

Three rows, one per page.

(cont.)

---

02 **A split page is page-tall.**

The lone row centers; the title moves down.

A centered box is not a centered line →

inventory · the parts ledger

Three rows, one per page.

(cont.)

---

03 A centered box is not a centered line.

The old ordinal centered on the box.

what changed

The ordinal's containing block is the title, not the row.

It stays out of the flow that stacks the bold lead over its body prose — the row still reserves the gutter — but it is now carried by whatever moves the title instead of having to chase it.

INVENTORY · COMPACT

compact splits the same way.

Same anchor, denser rows →

inventory · compact

compact splits the same way.

01 **Same anchor, denser rows.**

The offset is not re-tuned per variant.

The fallback is the old placement →

compact splits the same way. (cont.)

02 The fallback is the old placement.

A row with no lead has no title.

Measured on the render.

*On the portrait split page the ordinal was **199px** below its title (render px, 2x) and dead on the body's baseline. It is **2px** off the title now. Every non-split page renders byte-identical to before.*
